of Planet Ocean provides a learning tool to those who love the ocean to help them understand and learn about the life that populates it the extraordinary adaptations of marine organisms to their environment and the spectacular variety of marine life forms that inhabit the many marine habitats and contribute to the life support system of Planet Ocean The book introduces marine biology by seeing the ocean through the eyes of its inhabitants describing the properties of sea water the surface waters and its currents and the characteristics of the seabed according to how marine organisms perceive exploit and shape them This book explains to the reader and those who love the ocean not only how to recognize the most common marine organisms and habitats from the coast to great depths but it also explains their complex life cycles and the environmental factors controlling their distribution reproduction and growth Finally the book evaluates the role that living biota play in how different marine ecosystems function in order to understand better their characteristics peculiarities and threats This book offers an up to date and comprehensive text on the study of marine biology presenting insights into the methodologies scientists have adopted for the study of marine ecosystems It also includes chapters about human impacts on marine biodiversity from overfishing to climate change from pollution including microplastics to alien species invasions from conservation of marine resources to the restoration of degraded marine habitats The authors developed this text for Bachelor and Master s level students taking classes on marine biology and marine ecology but it will also interest high school students and marine enthusiasts dive masters tour guides who wish to deepen their knowledge of marine biology

Stress and Environmental Regulation of Gene Expression and Adaptation in Bacteria, 2 Volume Set Frans J. de Bruijn, 2016-09-06 Bacteria in various habitats are subject to continuously changing environmental conditions such as nutrient deprivation heat and cold stress UV radiation oxidative stress dessication acid stress nitrosative stress cell envelope stress heavy metal exposure osmotic stress and others In order to survive they have to respond to these conditions by adapting their physiology through sometimes drastic changes in gene expression In addition they may adapt by changing their morphology forming biofilms fruiting bodies or spores filaments Viable But Not Culturable VBNC cells or moving away from stress compounds via chemotaxis Changes in gene expression constitute the main component of the bacterial response to stress and environmental changes and involve a myriad of different mechanisms including alternative sigma factors σ^{32} or σ^{24} component regulatory systems small non coding RNA s chaperones CHRIS Cas systems DNA repair toxin antitoxin systems the stringent response efflux pumps alarmones and modulation of the cell envelope or membranes to name a few Many regulatory elements are conserved in different bacteria however there are endless variations on the theme and novel elements of gene regulation in bacteria inhabiting particular environments are constantly being discovered Especially in pathogenic bacteria colonizing the human body a plethora of bacterial responses to innate stresses such as pH reactive nitrogen and oxygen species and antibiotic stress are being described An attempt is made to not only cover model systems but give a broad overview of the stress responsive regulatory systems in a variety of bacteria including medically important

bacteria where elucidation of certain aspects of these systems could lead to treatment strategies of the pathogens Many of the regulatory systems being uncovered are specific but there is also considerable cross talk between different circuits Stress and Environmental Regulation of Gene Expression and Adaptation in Bacteria is a comprehensive two volume work bringing together both review and original research articles on key topics in stress and environmental control of gene expression in bacteria Volume One contains key overview chapters as well as content on one two three component regulatory systems and stress responses sigma factors and stress responses small non coding RNAs and stress responses toxin antitoxin systems and stress responses stringent response to stress responses to UV irradiation SOS and double stranded systems repair systems and stress adaptation to both oxidative and osmotic stress and desiccation tolerance and drought stress Volume Two covers heat shock responses chaperonins and stress cold shock responses adaptation to acid stress nitrosative stress and envelope stress as well as iron homeostasis metal resistance quorum sensing chemotaxis and biofilm formation and viable but not culturable VBNC cells Covering the full breadth of current stress and environmental control of gene expression studies and expanding it towards future advances in the field these two volumes are a one stop reference for non medical molecular geneticists interested in gene regulation under stress
