THE ARITHMETIC OF EQUATIONS

SECTION REVIEW

Objectives

- Calculate the amount of reactants required or product formed in a chemical process.
- Interpret balanced chemical equations in terms of interacting moles, representative particles, masses, and gas volume at STP.

Key Terms

- stoichiometry

Part A Completion

Copy this completion exercise for class. Your understanding of the concepts and terms is clear when indicated in this exercise. Blank blanks are the completed work of others; absent phrases are none.

- The coefficients in a balanced chemical equation indicate _____ 1. _____ the relative number of _____ 2. _____ of reactants and products. All stoichiometric calculations begin with a _____ 3. _____ (molar _____ 4. _____) and _____ 5. _____ are converted in every reaction; moles, volumes, and representative particles may not be.
- In solving stoichiometric problems, conversion factors relating moles of reactants to _____ 6. _____ of products are used.
- If you assume _____ 7. _____, the equation also tells you about the volume of gas.

Part B True-False

(Quickly mark off your answers to the statements as T for true or F for false; some answers may be C for cannot know, or D for never know, or N for never.

- _____ 7. The coefficients in a balanced chemical equation can be used to determine the relative number of moles of reactants and products.
- _____ 8. The coefficients in a balanced chemical equation tell the relative volumes of reactants and products, expressed in any suitable units of volume.
- _____ 9. To calculate the mass of a molecule in grams, you can use the molar mass and Avogadro's number.

Principles of Constraint Programming Krzysztof Apt, 2003-08-28 Constraints are everywhere most computational problems can be described in terms of restrictions imposed on the set of possible solutions and constraint programming is a problem solving technique that works by incorporating those restrictions in a programming environment It draws on methods

from combinatorial optimisation and artificial intelligence and has been successfully applied in a number of fields from scheduling computational biology finance electrical engineering and operations research through to numerical analysis This textbook for upper division students provides a thorough and structured account of the main aspects of constraint programming The author provides many worked examples that illustrate the usefulness and versatility of this approach to programming as well as many exercises throughout the book that illustrate techniques test skills and extend the text Pointers to current research extensive historical and bibliographic notes and a comprehensive list of references will also be valuable to professionals in computer science and artificial intelligence

Adaptive Computing in Design and Manufacture VI

I.C. Parmee, 2011-06-27 The Adaptive Computing in Design and Manufacture conference series has become a well established largely application oriented meeting recognised by several UK Engineering Institutions and the International Society of Genetic and Evolutionary Computing The main theme of the series relates to the integration of evolutionary and adaptive computing technologies with design and manufacturing processes whilst also taking into account complementary advanced computing technologies Evolutionary and adaptive computing techniques continue to increase their penetration of industrial and commercial practice as awareness of their powerful search exploration and optimisation capabilities becomes ever more prevalent and increasing desk top computational capability renders stochastic population based search a far more viable proposition There has been a significant increase in the development and integration of commercial software tools utilising adaptive computing technologies and the emergence of related commercial research and consultancy organisations supporting the introduction of best practice in terms of industrial utilisation The book is comprised of selected papers that cover a diverse set of industrial application areas including engineering design and design environments and manufacturing process design scheduling and control Various aspects of search exploration and optimisation are investigated in the context of integration with industrial processes including multi objective and constraint satisfaction development and utilization of meta models algorithm and strategy development and human centric evolutionary approaches The role of agent based and neural net technologies in terms of supporting search processes and providing an alternative simulation environment is also explored This collection of papers will be of particular interest to both industrial researchers and practitioners in addition to the academic research communities across engineering operational research and computer science
