Name _____

Section A: Endocrine vs. Nervous Systems

The endocrine and nervous systems function to regulate body activities. Since both systems are involved in regulation, how does the endocrine system differ in regulation compared to the nervous system? The nervous system uses electrical impulses and neurotransmitters to control processes. These impulses are localized and are extremely fast. The endocrine system is comprised of glands that use chemical messengers to influence a wide range of activities such as growth, development and metabolic activities. These chemical messengers called hormones regulate processes at a slower rate. The hormonal effects last longer and are more widespread within the body.

1. How are the nervous system and the endocrine system different?

Nervous System	Endocrine System

Section B: Intro to endocrine

1. What are hormones? _____
2. Most hormones circulate in blood and come into contact with essentially all cells. However, a specific hormone usually affects only a limited number of cells called _____ which contain receptors for that hormone. When hormones bind to receptors, it triggers a cascade of reactions within the cell that affects function.
3. Endocrine glands secrete hormones directly into the bloodstream while exocrine glands release secretions through ducts into cavities or body surfaces. Some endocrine glands have other functions beyond hormone production and secretion. These organs are called mixed glands. For example: In addition to hormone production, the pancreas secretes digestive enzymes into the small intestines. Consider the other endocrine glands and list glands that would be considered mixed based on the above criteria. _____

4. Label the endocrine organs in the diagram. thyroid, thymus, pineal, hypothalamus, pituitary, ovaries, testes, parathyroid, adrenal, pancreas
