

1. Executive Summary

The purpose of this vulnerability scan is to gather data on Windows and third-party software patch levels on specified hosts in the domain. The audit was performed on "DATE" using Nessus v8.2.2.

Of the 35 hosts identified, 32 systems were found to be active and were scanned. A total of 447 unique vulnerabilities were found during this scan. Critical, high, and medium severity vulnerabilities were found to exist across all 32 systems.

Vulnerability Risk	Unique Count
Critical Severity Vulnerabilities	44
High Severity Vulnerabilities	309
Medium Severity Vulnerabilities	84
Low Severity Vulnerabilities	10

The vulnerabilities found on Windows hosts consist of outdated Windows patches and third-party software including Google Chrome and Adobe Flash. Systems were also found to be missing patches from 2014. Older vulnerabilities present a more significant risk as malicious actors will often automate exploitation of known vulnerabilities in an attempt to catch the lowest hanging fruit. Therefore, we strongly recommend applying the latest patch to the outdated software as soon as possible.

The vulnerabilities found on the HP switches consist of TLS/SSL certificate vulnerabilities and deal mainly with using outdated encryption suites. Though outdated/self-signed certificates on internal devices are not as high risk as the same on external facing devices, proper, up-to-date SSL certificates should be installed to meet best practice. Additionally, switches were found to be running variations of 3 versions of firmware; these switches should be updated to the newest firmware supported by the vendor.

It is our recommendation that immediate action be taken to resolve these vulnerabilities by applying patches and adjusting system configurations as necessary.

In addition, a patch and configuration management process should be implemented to continually assess system risk level as vulnerabilities are discovered. This will ensure relevant security patches and configurations are applied in a timely manner.

2. Scan Results

We have included supplemental material to this report consisting of the Nessus scan results and Nessus report.

Scan Results - The scan results provide granular detail of each vulnerability, which are categorized by their severity: critical, high, medium, and low. An expanded definition of the known threat and solutions for remediating the vulnerability are also available.

Nessus Report – The Nessus Report provides a comprehensive analysis of the scan results.
