Seismic Design Of Reinforced Concrete Buildings:

Displacement-based Seismic Design of Reinforced Concrete Buildings fib Fédération internationale du béton, 2003 A brief summary of the history of seismic design as given in chapter 1 indicates that initially design was purely based on strength or force considerations When the importance of displacement however became better appreciated it was attempted to modify the existing force based approach in order to include considerations of displacement rather than to totally reconsider the procedure on a more rational basis In the last decade then several researchers started pointing out this inconsistency proposing displacement based approaches for earthquake engineering evaluation and design with the aim of providing improved reliability in the engineering process by more directly relating computed response and expected structural performance The main objective of this report is to summarize critically review and compare the displacement based approaches proposed in the literature thus favouring code implementation and practical use of rational and reliable methods Chapter 2 Seismic performance and design objectives of this report introduces concepts of performance levels seismic hazard representation and the coupling of performance and hazard to define performance objectives In fact for displacement analysis to be relevant in the context of performance based design the structural engineer must select appropriate performance levels and seismic loadings A critical review of some engineering limit states appropriate to the different performance levels is therefore proposed In chapter 3 Conceptual basis for displacement based earthquake resistant design the fundamental principles associated with displacement of the ground during an earthquake and the effects in terms of displacement in the structure are reviewed The historical development guides the presentation with a review of general linear and nonlinear structural dynamics principles general approaches to estimate displacement for both ground and structure and finally a general presentation of the means to measure and judge the appropriateness of the displacements of the structure in section Chapter 4 Approaches and procedures for displacement based design can be somehow considered the fundamental part of the report since a critical summary of the displacement based approaches proposed by different researchers is presented there Displacement based design may require specific characterization of the input ground motion a topic addressed in Chapter 5 Seismic input In general various pertinent definitions of input motion for non code format analysis are included while peak ground parameters necessary for code base shear equations are only addressed as needed for the definition of motion for analysis Chapter 6 Displacement capacity of members and systems addresses the fundamental problem of evaluating the inelastic displacement capacity of reinforced concrete members and realistic values of their effective cracked stiffness at yielding including effects of shear and inclined cracking anchorage slip bar buckling and of load cycling In Chapter 7 Application and evaluation of displacement based approaches some of the many different displacement based design procedures briefly introduced in Chapter 4 are applied to various case studies identifying and discussing the difficulties a designer may encounter when trying to use displacement based design Results for five different case studies

designed in accordance with eight different displacement based design methods are presented Although in general case studies are considered a useful but marginal part of a state of the art document in this case it has to be noted that chapter 7 is possibly the most innovative and fundamental part of the whole report The conclusions of chapter 7 are the fundamental and essential conclusions of the document and allow foreseeing a bright future for displacement based design approaches The state of art report has been elaborated over a period of 4 years by Task Group 7.2 Displacement based design and assessment of fib Commission 7 Seismic design a truly international team of experts representing the expertise and experience of all the important seismic regions of the world In October 2002 the final draft of the Bulletin was presented to the public during the 1st fib Congress in Osaka It was also there that it was approved by fib Commission 7 Seismic Design

Seismic Design of Concrete Buildings to Eurocode 8 Michael Fardis,Eduardo Carvalho,Peter Fajfar,Alain Pecker,2015-02-04 An Original Source of Expressions and Tools for the Design of Concrete Elements with Eurocode Seismic design of concrete buildings needs to be performed to a strong and recognized standard Eurocode 8 was introduced recently in the 30 countries belonging to CEN as part of the suite of Structural Eurocodes and it represents the first European Standard *Automated Seismic Design of Reinforced Concrete Buildings* Y. S. Chung,1988 A new automatic method for the seismic design of reinforced concrete frame buildings is presented A new damage index is reviewed which serves as a measure of a

member's residual energy dissipation capacity and is suitable as a control parameter in an automated design method. The method proposed aims for a uniform energy dissipation throughout the building frame as measured by the individual member damage indices. The new damage index is modeled on the low cycle fatigue phenomenon exhibited by reinforced concrete members subjected to strong inelastic cyclic loads. It accounts for the observed stiffness and strength deterioration, includes a modified Miner's Rule for variable amplitude loading and considers the effect of load history. These features make the damage index a useful measure of a member's capacity to resist further cyclic loading. The automatic design method is based on a thorough study of the effects of three important design variables: the longitudinal reinforcement, the confinement steel and member depth. Design rules derived from the large number of numerical studies allow an iterative improvement of a preliminary design until the distribution of damage indices has reached a user-specified degree of uniformity. The usefulness of this design method, which incorporates aspects of a knowledge-based expert system, is demonstrated with a typical four-story three-bay office building. Abstract Concrete Buildings in Seismic Regions George G. Penelis, Gregory G.

Penelis, 2014-03-24 Bearing in mind that reinforced concrete is a key component in a majority of built environment structures, *Concrete Buildings in Seismic Regions* combines the scientific knowledge of earthquake engineering with a focus on the design of reinforced concrete buildings in seismic regions. This book addresses practical design issues, providing an integrated, comprehensible and clear presentation that is suitable for design practice. It combines current approaches to seismic analysis and design with a particular focus on reinforced concrete structures and includes an overview of structural dynamics, analysis and design of new R/C buildings in seismic regions, post-earthquake damage evaluation, pre-earthquake assessment of buildings and retrofitting procedures, seismic risk management of R/C buildings within urban nuclei, extended numerical example applications. *Concrete Buildings in Seismic Regions* determines guidelines for the proper structural system for many types of buildings, explores recent developments and covers the last two decades of analysis, design and earthquake engineering. Divided into three parts, the book specifically addresses seismic demand issues and the basic issues of structural dynamics, considers the capacity of structural systems to withstand seismic effects in terms of strength and deformation and highlights existing R/C buildings under seismic action. All of the book material has been adjusted to fit a modern seismic code and offers in-depth knowledge of the background upon which the code rules are based. It complies with the last edition of European Codes of Practice for R/C buildings in seismic regions and includes references to the American Standards in effect for seismic design.
