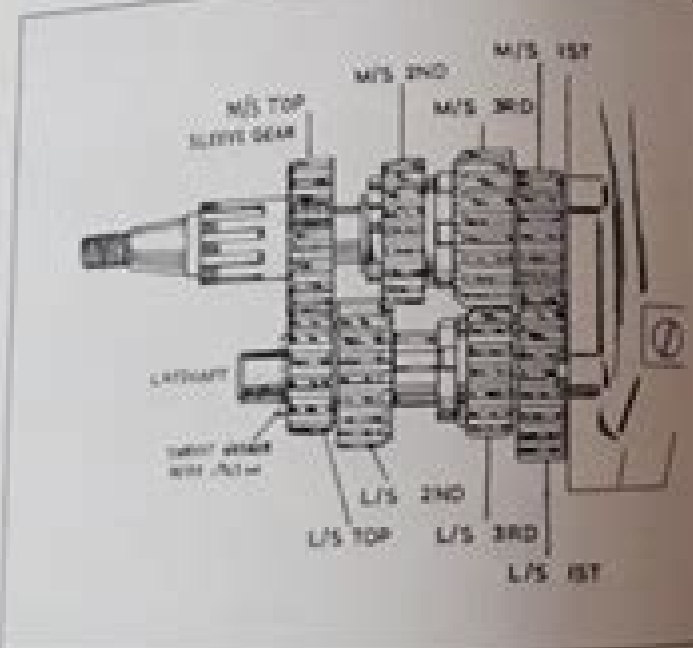

Fig 9.15 - Gear change seen from the front

To adjust spring tension:

1. Fit the selector fork into the hole in the sleeve.
2. Fit a selector fork into it.
3. Fit the spring assembly. The fork's hole is the same.

The aim is to adjust the position of the spring when the selector is in the sleeve, so that there is a constant clearance between the edge of the spring and the selector fork and vertically, so that the push of the spring is to line with the selector fork when the spring is depressed as it will be when the cam plate pushes against it. Measure the spring with a finger in your eye. When you push the spring down, it should be the same and should be the same.

Setting the (new) gear change spring (Fig 9.14 and 9.15)

When fitted to the gear change shaft, a new spring should sit straight and be level, and should connect to the plate without any bending. If it does, it is the wrong one.

You have to actually fit and measure the spring. There is a lot of a lot to it. The part of the spring that is left - hard to describe, but it helps to get a wire through the hole in the hole to adjust the spring.

There should also be no gap in the spring when the selector is in the sleeve. If you are not happy with the fit of your new spring, take it back to the vendor and compare it with the quality of the parts from the donor.
