Simulations of Gas Phase Detonations ,1980 Detailed numerical simulations of supersonic reactive flow and gas phase detonation problems are very expensive due to their computer time and memory requirements The bulk of this cost is in integrating the ordinary differential equations describing chemical reactions A global induction parameter model has thus been developed which describes the chemical induction time of a mixture and allows for release of energy over a finite time period The specific gases for which it has been calibrated are stoichiometric mixtures of hydrogen and methane in air The relatively inexpensive induction parameter model is then used in time dependent one and two dimensional simulations of supersonic reactive flows Author **Applied Animal Endocrinology, 3rd Edition** E. James Squires,2024-04-23 This book explains the role of hormones in improving and monitoring the production performance reproduction behaviour and health of livestock animals focusing on cattle pigs sheep horses poultry and fish Beginning with the principles of endocrinology and the methods to study endocrine systems it then covers the different endocrine systems that affect different aspects of animal production and describes how these systems can be manipulated or monitored to advantage The mechanism of action is covered and common mechanisms and themes highlighted in order to understand potential methods for altering these systems and stimulate ideas for the development of new methods An invaluable text for students of animal science and veterinary medicine this book also provides a useful resource for those in academia and industry interested in applications of endocrinology in animal production systems Comprehensive Nuclear Materials ,2020-07-22 Materials in a nuclear environment are exposed to extreme conditions of radiation temperature and or corrosion and in many cases the combination of these makes the material behavior very different from conventional materials This is evident for the four major technological challenges the nuclear technology domain is facing currently i long term operation of existing Generation II nuclear power plants ii the design of the next generation reactors Generation IV iii the construction of the ITER fusion reactor in Cadarache France iv and the intermediate and final disposal of nuclear waste In order to address these challenges engineers and designers need to know the properties of a wide variety of materials under these conditions and to understand the underlying processes affecting changes in their behavior in order to assess their performance and to determine the limits of operation Comprehensive Nuclear Materials Second Edition Seven Volume Set provides broad ranging validated summaries of all the major topics in the field of nuclear material research for fission as well as fusion reactor systems Attention is given to the fundamental scientific aspects of nuclear materials fuel and structural materials for fission reactors waste materials and materials for fusion reactors The articles are written at a level that allows undergraduate students to

understand the material while providing active researchers with a ready reference resource of information. Most of the chapters from the first Edition have been revised and updated and a significant number of new topics are covered in completely new material. During the ten years between the two editions the challenge for applications of nuclear materials has been significantly impacted by world events, public awareness and technological innovation. Materials play a key role as enablers of new technologies and we trust that this new edition of Comprehensive Nuclear Materials has captured the key recent developments. Critically reviews the major classes and functions of materials supporting the selection, assessment, validation and engineering of materials in extreme nuclear environments. Comprehensive resource for up to date and authoritative information which is not always available elsewhere even in journals. Provides an in depth treatment of materials modeling and simulation with a specific focus on nuclear issues. Serves as an excellent entry point for students and researchers new to the field. **Scientific and Technical Aerospace Reports**, 1989 *Chemical Reaction*

Engineering--Houston V. W. Weekman (jr), Dan Luss, 1978 **Chemical Age**, 1921 **Literature 1986, Part 1** Prof. Dr. Roland Wielen, S. Böhme, U. Esser, H. Hefele, Inge Heinrich, W. Hofmann, D. Krahn, V. R. Matas, Dr. Lutz D. Schmadel, G. Zech, 2013-04-17 Selective Catalytic Reduction of NO_x Oliver Kröcher, 2018-12-14 This book is a printed edition of the Special Issue Selective Catalytic Reduction of NO_x that was published in Catalysts Activated Barrier Crossing: Applications In Physics, Chemistry And Biology Graham R Fleming, Peter Hanggi, 1993-12-22 The passage of a system from one minimum energy state to another via a potential energy barrier provides a model for the microscopic description of a wide range of physical, chemical and biological phenomena. Examples include diffusion of atoms in solids or on surfaces, flux transitions in superconducting quantum interference devices (SQUIDs), isomerization reactions in solution, electron transfer processes and ligand binding in proteins. In general, both tunneling and thermally activated barrier crossing may be involved in determining the rate. This book surveys key experiments chosen from physics, chemistry and biology and describes theoretical methods appropriate for both classical and quantum barrier crossing. A major feature of the book is the attempt to integrate the experimental and theoretical work in one volume. **Chemical Reactivity in Confined Systems** Pratim Kumar Chattaraj, Debduutta Chakraborty, 2021-08-13 An insightful analysis of confined chemical systems for theoretical and experimental scientists. Chemical Reactivity in Confined Systems: Theory and Applications presents a theoretical basis for the molecular phenomena observed in confined spaces. The book highlights state-of-the-art theoretical and computational approaches with a focus on obtaining physically relevant clarification of the subject to enable the reader to build an appreciation of underlying chemical principles. The book includes real-world examples of confined systems that highlight how the reactivity of atoms and molecules change upon encapsulation. Chapters include discussions on recent developments related to several host-guest systems including cucurbit[n]uril, ExBox-4 clathrate hydrates, octa-acid-cavitand, metal-organic frameworks (MOFs), covalent organic frameworks (COFs), zeolites, fullerenes and carbon nanotubes. Readers will learn how to

carry out new calculations to understand the physicochemical behavior of confined quantum systems Topics covered include A thorough introduction to global reactivity descriptors including electronegativity hardness and electrophilicity An exploration of the Fukui function as well as dual descriptors higher order derivatives and reactivity through information theory A practical discussion of spin dependent reactivity and temperature dependent reactivity Concise treatments of population analysis reaction force electron localization functions and the solvent effect on reactivity Perfect for academic researchers and graduate students in theoretical and computational chemistry and confined chemical systems Chemical Reactivity in Confined Systems Theory and Applications will also earn a place in the libraries of professionals working in the areas of catalysis supramolecular chemistry and porous materials *NBS Publications Newsletter* ,1979 A newsletter for librarians documentalists and science information specialists
