Viable But Not Culturable VBNC cells or moving away from stress compounds via chemotaxis Changes in gene expression constitute the main component of the bacterial response to stress and environmental changes and involve a myriad of different mechanisms including alternative sigma factors bi or tri component regulatory systems small non coding RNA s chaperones CHRIS Cas systems DNA repair toxin antitoxin systems the stringent response efflux pumps alarmones and modulation of the cell envelope or membranes to name a few Many regulatory elements are conserved in different bacteria however there are endless variations on the theme and novel elements of gene regulation in bacteria inhabiting particular environments are constantly being discovered Especially in pathogenic bacteria colonizing the human body a plethora of bacterial responses to innate stresses such as pH reactive nitrogen and oxygen species and antibiotic stress are being described An attempt is made to not only cover model systems but give a broad overview of the stress responsive regulatory systems in a variety of bacteria including medically important bacteria where elucidation of certain aspects of these systems could lead to treatment strategies of the pathogens Many of the regulatory systems being uncovered are specific but there is also considerable cross talk between different circuits Stress and Environmental Regulation of Gene Expression and Adaptation in Bacteria is a comprehensive two volume work bringing together both review and original research articles on key topics in stress and environmental control of gene expression in bacteria Volume One contains key overview chapters as well as content on one two three component regulatory systems and stress responses sigma factors and stress responses small non coding RNAs and stress responses toxin antitoxin systems and stress responses stringent response to stress responses to UV irradiation SOS and double stranded systems repair systems and stress adaptation to both oxidative and osmotic stress and desiccation tolerance and drought stress Volume Two covers heat shock responses chaperonins and stress cold shock responses adaptation to acid stress nitrosative stress and envelope stress as well as iron homeostasis metal resistance quorum sensing chemotaxis and biofilm formation and viable but not culturable VBNC cells Covering the full breadth of current stress and environmental control of gene expression studies and expanding it towards future advances in the field these two volumes are a one stop reference for non medical molecular geneticists interested in gene regulation under stress

linked to consumption of foods beverages and drinking water that contain pathogenic microbes toxins or other toxic agents foodborne diseases have undergone a remarkable change of fortune in recent decades from once rare and insignificant malaises to headline grabbing and deadly outbreaks Unquestionably several factors have combined to make this happen These include a prevailing demand for the convenience of ready to eat or heat and eat manufactured food products that allow ready entry and survival of some robust temperature insensitive microorganisms a drastic reduction in the costs of air sea and road transportation that has taken some pathogenic microorganisms to where they were absent previously an expanding world population that has stretched the boundary of human activity and an ageing population whose weakened immune functions provide a fertile ground for opportunistic pathogens to invade and thrive Given the diversity of causative agents ranging from viruses bacteria yeasts filamentous fungi protozoa helminthes toxins to toxic agents and the ingenuity of pathogenic microbes to evolve through genetic reassortment horizontal gene transfer and or random genetic mutation it has become an enormous challenge to understand how foodborne agents are able to evade host immune defenses and induce diseases and also to develop and apply innovative approaches for improved diagnosis treatment and prevention of foodborne diseases Handbook of Foodborne Diseases summarizes the latest findings on more than 100 foodborne diseases and their causative agents With contributions from international experts on foodborne pathogens toxins and toxic agents research this volume provides state of the art overviews on foodborne diseases in relation to their etiology biology epidemiology clinical presentation pathogenesis diagnosis treatment and prevention Apart from offering a comprehensive textbook for undergraduate and postgraduate students in food medical and veterinary microbiology this volume constitutes a valuable reference on foodborne diseases for medical professionals and health authorities and forms an informative educational resource for the general public

The Prokaryotes M.P. Starr,H. Stolp,H.G. Trüper,A. Balows,H.G. Schlegel,2013-11-11

The purpose of this brief Foreword is to make you the reader hungry for the scientific feast that follows These two volumes on the prokaryotes offer a truly unique scientific menu a comprehensive assembly of articles exhibiting the biochemical depth and remarkable physiological and morphological diversity of prokaryote life The size of the volumes might initially discourage the unprepared mind from being attracted to the study of prokaryote life for this landmark assemblage thoroughly documents the wealth of present knowledge But in confronting the reader with the state of the art the Handbook also defines where new work needs to be done on well studied bacteria as well as on unusual or poorly studied organisms There are basically two ways of doing research with microbes A classical approach is first to define the phenomenon to be studied and then to select the organism accordingly Another way is to choose a specific organism and go where it leads The pursuit of an unusual microbe brings out the latent hunter in all of us The intellectual challenges of the chase frequently test our ingenuity to the limit Sometimes the quarry repeatedly escapes but the final capture is indeed a wonderful experience For many of us these simple rewards are sufficiently gratifying so that we have chosen to spend our scientific lives studying these
