Post-Translational Modifications Fiammetta Alagna, Michele Bellucci, Dario Leister, Andrea Pompa, 2017-12-28 Due to their bacterial endosymbiotic origin plastids are organelles with both nuclear encoded and plastid encoded proteins Therefore a highly integrated modulation of gene expression between the nucleus and the plastome is needed in plant cell development

Plastids have retained for the most part a prokaryotic gene expression machinery but differently from prokaryotes and eukaryotes they have largely abandoned transcriptional control and switched to predominantly translational control of their gene expression. Some transcriptional regulation is known to occur but the coordinate expression between the nucleus and the plastome takes place mainly through translational regulation. However the regulatory mechanisms of plastid gene expression PGE are mediated by intricate plastid nuclear interactions and are still far from being fully understood. Although for example translational autoregulation mechanisms in algae have been described for subunits of heteromeric protein complexes and termed control by epistasy of synthesis CES only few autoregulatory proteins have been identified in plant plastids. It should be noted of course that PGE in *C. reinhardtii* is different from that in plants in many aspects. Another example of investigation in this research area is to understand the interactions that occur during RNA binding between nucleus encoded RNA binding proteins and the respective RNA sequences and how this influences the translation initiation process. In addition to this the plastid retains a whole series of mechanisms for the preservation of its protein balance proteostasis including specific proteases as well as molecular chaperones and enzymes useful in protein folding. After synthesis plastid proteins must rapidly fold into stable three dimensional structures and often undergo co and posttranslational modifications to perform their biological mission avoiding aberrant folding aggregation and targeting with the help of molecular chaperones and proteases. We believe that this topic is highly interesting for many research areas because the regulation of PGE is not only of wide interest for plant biologists but has also biotechnological implications. Indeed plastid transformation turns out to be a very promising tool for the production of recombinant proteins in plants yet some limitations must still be overcome and we believe that this is mainly due to our limited knowledge of the mechanisms in plastids influencing the maintenance of proteostasis.

Plasmids Marcelo E. Tolmasky, Juan C. Alonso, 2020-07-24 Explore the remarkable discoveries in the rapidly expanding field of plasmid biology. Plasmids are integral to biological research as models for innumerable mechanisms of living cells as tools for creating the most diverse therapies and as crucial helpers for understanding the dissemination of microbial populations. Their role in virulence and antibiotic resistance together with the generalization of omics disciplines has recently ignited a new wave of interest in plasmids. This comprehensive book contains a series of expertly written chapters focused on plasmid biology mechanistic details of plasmid function and the increased utilization of plasmids in biotechnology and pharmacology that has occurred in the past decade. *Plasmids: Biology and Impact in Biotechnology and Discovery* serves as an invaluable reference for researchers in the wide range of fields and disciplines that utilize plasmids and can also be used as a textbook for upper level undergraduate and graduate courses in biotechnology and molecular biology.
