

Given  $A(x_1, y_1)$  and  $B(x_2, y_2)$ , what are the points  $C$  and  $D$  that divide  $\overline{AB}$  into three parts of equal length?

$$C(-1, 5)$$

$$D(3, 1)$$

Fraction of distance / length

$$(x, y) = (x_1 + k(x_2 - x_1), y_1 + k(y_2 - y_1))$$

$$\begin{aligned} C &\Rightarrow (-5 + \frac{1}{3}(7 - (-5)), 9 + \frac{1}{3}(-3 - 9)) \\ &= (-5 + 4, 9 - 4) \\ &= (-1, 5) \end{aligned}$$

$$\begin{aligned} D &\Rightarrow (-5 + \frac{2}{3}(7 - (-5)), 9 + \frac{2}{3}(-3 - 9)) \\ &= (3, 1) \end{aligned}$$

**Computer-Aided Geometric Design** Fujio Yamaguchi, 2011-06-28 Computer graphics computer aided design and computer aided manufacturing are tools

that have become indispensable to a wide array of activities in contemporary society Euclidean processing provides the basis for these computer aided design systems although it contains elements that inevitably lead to an inaccurate non robust and complex system The primary cause of the deficiencies of Euclidean processing is the division operation which becomes necessary if an  $n$  space problem is to be processed in  $n$  space The difficulties that accompany the division operation may be avoided if processing is conducted entirely in  $n-1$  space The paradigm attained through the logical extension of this approach totally four dimensional processing is the subject of this book This book offers a new system of geometric processing techniques that attain accurate robust and compact computations and allow the construction of a systematically structured CAD system

*Optimization in Solving Elliptic Problems* Eugene G. D'yakonov, 2018-05-04 Optimization in Solving Elliptic Problems focuses on one of the most interesting and challenging problems of computational mathematics the optimization of numerical algorithms for solving elliptic problems It presents detailed discussions of how asymptotically optimal algorithms may be applied to elliptic problems to obtain numerical solutions meeting certain specified requirements Beginning with an outline of the fundamental principles of numerical methods this book describes how to construct special modifications of classical finite element methods such that for the arising grid systems asymptotically optimal iterative methods can be applied Optimization in Solving Elliptic Problems

describes the construction of computational algorithms resulting in the required accuracy of a solution and having a pre determined computational complexity Construction of asymptotically optimal algorithms is demonstrated for multi dimensional elliptic boundary value problems under general conditions In addition algorithms are developed for eigenvalue problems and Navier Stokes problems The development of these algorithms is based on detailed discussions of topics that include accuracy estimates of projective and difference methods topologically equivalent grids and triangulations general theorems on convergence of iterative methods mixed finite element methods for Stokes type problems methods of solving fourth order problems and methods for solving classical elasticity problems Furthermore the text provides methods for managing basic iterative methods such as domain decomposition and multigrid methods These methods clearly developed and explained in the text may be used to develop algorithms for solving applied elliptic problems The mathematics necessary to understand the development of such algorithms is provided in the introductory material within the text and common specifications of algorithms that have been developed for typical problems in mathema
