

Moon Note-Taking Guide

Why do we see the same face of the moon?

Because the moon rotates around its axis at the same rate that it orbits Earth, we always see the same side of the moon. This is called synchronous rotation. The moon's rotation period is the same as its orbital period, which is approximately 27.3 days. This is a result of tidal locking, which occurred as the moon moved away from Earth. As the moon's orbit expanded, its rotation slowed down until it matched its orbital period. This is why we always see the same face of the moon.

The Moon

The moon is the only natural satellite of Earth. It is a rocky, airless sphere with a heavily cratered surface. The moon's diameter is about 1/4 that of Earth, and its mass is about 1/81 that of Earth. The moon's surface is covered in craters of various sizes, from small pits to large basins. The moon's atmosphere is extremely thin, and it has no magnetic field. The moon's gravity is about 1/6 that of Earth's. The moon's orbit around Earth is elliptical, and it takes about 27.3 days to complete one orbit. The moon's phases are caused by the changing angles of the sun, Earth, and moon.

MOON PHASES

The moon's phases are the different shapes that the moon appears to have from Earth. The phases are caused by the changing angles of the sun, Earth, and moon. The moon's phases are: New Moon, Waxing Crescent, First Quarter, Waxing Gibbous, Full Moon, Waning Gibbous, Last Quarter, and Waning Crescent. The moon's phases repeat every 29.5 days, which is the length of a lunar month.
