

ROTATIONAL EQUILIBRIUM: SIMULATING ASSIGNMENT

GOALS: After this activity, you will be able to calculate the condition <https://www.youtube.com/watch?v=3333333333> for the system to be in rotational equilibrium. You will also be able to calculate the condition for the system to be in rotational equilibrium and the condition for the system to be in rotational equilibrium.

Rotational equilibrium occurs when the net torque on the system is zero. This means that the sum of all the torques acting on the system is zero. The torque is the product of the force and the distance from the pivot point to the point of application of the force. The torque is a vector quantity, and it is represented by the symbol τ . The torque is calculated as follows:

Problem 1: A 100 N force is applied to a 2 m long beam.

Calculate the torque on the beam if the force is applied at the end of the beam. What is the torque if the force is applied at the midpoint of the beam? Calculate the torque if the force is applied at the end of the beam.

Problem 2: A 100 N force is applied to a 2 m long beam.

Calculate the torque on the beam if the force is applied at the end of the beam. What is the torque if the force is applied at the midpoint of the beam? Calculate the torque if the force is applied at the end of the beam.

Problem 3: A 100 N force is applied to a 2 m long beam. Calculate the torque on the beam if the force is applied at the end of the beam. What is the torque if the force is applied at the midpoint of the beam? Calculate the torque if the force is applied at the end of the beam.
