Heavy Traffic Daniel Madar, 2011-11-01 Canada and the United States exchange the world's highest level of bilateral trade valued at 1.4 billion a day Two thirds of this trade travels on trucks Heavy Traffic examines the way in which the regulatory reform of American and Canadian trucking coupled with free trade has internationalized this vital industry Before deregulation restrictive entry rules had fostered two separate national highway transportation markets and most international traffic had to be exchanged at the border When the United States deregulated first the imbalance between its

opened market and Canada's still restricted one produced a surprisingly difficult bilateral dispute. American deregulation was motivated by domestic incentives but the subsequent Canadian deregulation blended domestic incentives with transborder rate comparisons and concerns about trade competitiveness. Daniel Madar shows that deregulation created a de facto regime of free trade in trucking services. Removing regulatory barriers has enabled Canadian and American carriers to follow the expansion of transborder traffic that began with the Canada-US Free Trade Agreement and continues with NAFTA. The services available with deregulated trucking have also supported sweeping changes in industrial logistics. As transborder traffic has surged, the two countries' carriers from billion-dollar corporations to family firms have exploited the latitude provided by deregulation. This book is a valuable contribution to our understanding of the policy processes and economic conditions that led to trucking deregulation. As a study in public policy formation and the international effects of reform, it will be of interest to students and scholars of political economy, international relations, and transportation.

Design and Analysis of Composite Structures for Automotive Applications Vladimir Kobelev, 2019-06-10. A design reference for engineers developing composite components for automotive chassis, suspension, and drivetrain applications. This book provides a theoretical background for the development of elements of car suspensions. It begins with a description of the elastic kinematics of the vehicle and closed-form solutions for the vertical and lateral dynamics. It evaluates the vertical, lateral, and roll stiffness of the vehicle and explains the necessity of the modelling of the vehicle stiffness. The composite materials for the suspension and powertrain design are discussed, and their mechanical properties are provided. The book also looks at the basic principles for the design optimization using composite materials and mass reduction principles. Additionally, references and conclusions are presented in each chapter.

Design and Analysis of Composite Structures for Automotive Applications: Chassis and Drivetrain offers complete coverage of chassis components made of composite materials and covers elastokinematics and component compliances of vehicles. It looks at parts made of composite materials such as stabilizer bars, wheels, half-axes, springs, and semi-trail axles. The book also provides information on leaf spring assembly for motor vehicles and motor vehicle springs comprising composite materials. Covers the basic principles for the design optimization using composite materials and mass reduction principles. Evaluates the vertical, lateral, and roll stiffness of the vehicle and explains the modelling of the vehicle stiffness. Discusses the composite materials for the suspension and powertrain design. Features closed-form solutions of problems for car dynamics explained in details and illustrated pictorially.

Design and Analysis of Composite Structures for Automotive Applications: Chassis and Drivetrain is recommended primarily for engineers dealing with suspension design and development and those who graduated from automotive or mechanical engineering courses in technical high school or in other higher engineering schools.
