

Flow Cytometry

Introduction to Flow Cytometry

The CELL-DYN Ruby uses flow cytometric techniques to analyze the RBC/PLT, WBC, and NOC populations. This section gives a brief introduction to the principles of flow cytometry¹.

Flow cytometry is a process in which individual cells or other biological particles in a single file produced by a fluid stream are passed through a beam of light. A sensor or sensors measure, by the loss or scattering of light, the physical or chemical characteristics of the cells or particles².

Flow cytometry enables the rapid screening of large numbers of cells and provides quantitative cell analysis at the single-cell level. The basic components of a flow cytometer include:

- A sample collector and transporter
- A flow system to focus the sample flow stream
- A light source and focusing optics
- Light collectors, signal detectors, and polarizers
- Data collection and storage
- Data display and analysis
