

USE OF GLUCOSE-LOWERING MEDICATIONS IN THE MANAGEMENT OF TYPE 2 DIABETES

HEALTHY LIFESTYLE BEHAVIORS; DIABETES SELF-MANAGEMENT EDUCATION AND SUPPORT (DSMES); SOCIAL DETERMINANTS OF HEALTH (SDOH)

Goal: Cardiovascular Risk Reduction in High-Risk Patients with Type 2 Diabetes (in addition to comprehensive CV risk management)*

Goal: Achievement and Maintenance of Glycemic and Weight Management Goals

• AACEVD†

Defined differently across CVDs but all included individuals with established CVD (e.g., MI, stroke, any revascularization procedure). Variably included conditions such as transient ischemic attack, unstable angina, angiodysplasia, symptomatic or asymptomatic coronary artery disease.

• Indicators of high risk

While definitions vary, most comprise ≥55 years of age with two or more additional risk factors (including obesity, hypertension, smoking, dyslipidemia, or albuminuria).

• eGFR

Current or prior symptoms of HF with documented BNP or HFrEF

• eGFR

• eGFR ≥30 mL/min per 1.73 m² or SBP albuminuria (A2) ≥3.0 mg/dL (30mg/g). These measurements may vary over time, thus, a repeat measure is required to document CKD.

• eGFR for maximally tolerated dose of ACEi/ARB

PREFERABLE

• SGLT2i with primary evidence of reducing CVD progression

Use SGLT2i in people with an eGFR ≥20 mL/min per 1.73 m², once initiated should be continued until initiation of dialysis or transplantation

• SGLT2i with proven CV benefit if SGLT2i not tolerated or contraindicated

• If HbA_{1c} above target, for patients on SGLT2i, consider incorporating a GLP-1 RA or vice versa

• eGFR

• SGLT2i with proven HF benefit in this population

• AACEVD† Indicators of High Risk

GLP-1 RA* with proven CVD benefit **OR** SGLT2i with proven CVD benefit

If HbA_{1c} above target

- For patients on a GLP-1 RA consider adding SGLT2i with proven CVD benefit or vice versa
- TZD*

If additional cardiovascular risk reduction or glycemic lowering needed

Glycemic Management: Choose approaches that provide the efficacy to achieve goals.

Metformin (or Agent(s) including COMBINATION therapy that provide adequate EFFICACY to achieve and maintain treatment goals. Consider avoidance of hypoglycemia a priority in high-risk individuals.

In general, higher efficacy approaches have greater likelihood of achieving glycemic goals.

Efficacy for glucose lowering

Very High:
Dulaglutide (high dose), Semaglutide, Tirzepatide

Insulin
Combination (oral, Combination Injectable (GLP-1 RA/Insulin))

High:
GLP-1 RA (not listed above), Metformin, SGLT2i, Sulfonylurea, TZD

Intermediate:
DPP-4i

Achievement and Maintenance of Weight Management Goals:

Set individualized weight management goals

General lifestyle advice: medical nutrition therapy/behavioral pattern/physical activity

Intensive evidence-based structured weight management program

Consider medication for weight loss

Consider metabolic surgery

When choosing glucose-lowering therapies: Consider regimens with high-to-very-high dual glucose and weight efficacy

Efficacy for weight loss

Very High:
Semaglutide, Tirzepatide

High:
Dulaglutide, Liraglutide

Intermediate:
GLP-1 RA (not listed above), SGLT2i

Neutral:
DPP-4i, Metformin

If HbA_{1c} above target

Identify barriers to goals:

- Consider DSMES referral to support self-efficacy in achievement of goals
- Consider technology (e.g., diagnostic CGM) to identify therapeutic gaps and tailor therapy
- Identify and address SDOH that impact achievement of goals

* In people with HF, CKD, established CVD or multiple risk factors for CVD, the decision to use a GLP-1 RA or SGLT2i with proven benefit should be independent of background use of metformin. A strong recommendation is warranted for people with CVD and a weaker recommendation for those with indicators of high CV risk. Moreover, a higher absolute risk reduction and thus lower number needed to treat are seen at higher levels of baseline risk and should be factored into the shared decision-making process. See text for details. † Low-dose TZD may be better tolerated and similarly effective. ‡ For SGLT2i, CV renal outcomes trials demonstrate their efficacy in reducing the risk of composite MACE, CV death, all-cause mortality, HF, and renal outcomes in individuals with T2D with established high risk of CVD. § For GLP-1 RA, CVDs demonstrate their efficacy in reducing composite MACE, CV death, all-cause mortality, MI, stroke, and renal outcomes in individuals with T2D with established high risk of CVD.
