

Several methods for discharge measurements of floods

OGNJEK BONACCI

Faculty of Civil Engineering Sciences,
Split, Yugoslavia

ABSTRACT Flow discharge measurements during floods are of considerable importance. These data are very valuable and particularly difficult to obtain. In addition, such measurements are very expensive and often the lives of the people carrying them out are endangered. The paper describes several methods of discharge measurements during floods. It also presents some practical experience with the following types of measurements as variants of the moving boat method: discharge measurements of the whole flood wave using one or two boats employing only the current meter; and the rising floats of different rise speed.

Plusieurs méthodes de mesure du débit des crues

RÉSUMÉ Les mesures du débit lors des crues sont d'une importance capitale. Ces données sont du plus grand intérêt mais très difficiles à obtenir et les gens qui s'en chargent s'exposent très souvent à des dangers extrêmes. Notre travail traite de plusieurs méthodes de mesure du débit des crues. On expose les principes de fonctionnement et les expériences pratiques concernant les méthodes suivantes: méthode intégrée, mesure de l'hydrogramme complet avec une ou deux embarcations et la méthode de mesure en cas de très fortes crues avec deux flotteurs ayant des vitesses d'émergence différentes.

INTRODUCTION

The objective of this paper is to present several methods for discharge measurement of floods. It is often very difficult to carry out such measurements, for the procedure is time-consuming and the lives of the people carrying them out may be at risk. On the other hand, data on discharge measurements and other dynamic characteristics of open streamflow are particularly important in such difficult situations. Under such conditions measurements should above all be accurate but must also be as brief as possible even if this partly affects the accuracy. The main reason for this is that we have to define the complete discharge curves within total amplitude of water level oscillations. In Yugoslavia discharge measurements fail to cover on the average ca 20-30% of this amplitude (Bonacci & Šnur, 1971). In most cases the upper part of the amplitude, i.e. the flood period, is the part omitted. Experience in many African countries shows that discharge measurements in these countries fail to cover up to 60-80% of the water
