Additive Migration from Plastics Into Foods Thomas Roy Crompton, 2007 Plastics are now being used on a large scale for the packaging of fatty and aqueous foodstuffs and beverages both alcoholic and non alcoholic Thus it is likely that some transfer of polymer additives will occur adventitious impurities such as monomers oligomers catalyst remnants and residual polymerisation solvents and low molecular weight polymer fractions from the plastic into the packaged material with the consequent risk of a toxic hazard to the consumer This book covers all aspects of the migration of additives into food and gives detailed information on the analytical determination of the additives in various plastics This book will be of interest to those engaged in the implementation of packaging legislation including management analytical chemists and the manufacturers of foods beverages pharmaceuticals and cosmetics and also scientific and toxicologists in the packaging industry **Nanolithography and Patterning Techniques in Microelectronics** D Bucknall, 2005-09-30 Currently surface patterning is achieved by means of optical lithographic techniques but with industry moving towards the fabrication of devices with size features of 100 nm less the technological community is looking for alternative approaches to materials fabrication at the nanoscale By using nanolithography scientists can drive patterning currents through surfaces while

building a 3D structure from a series of patterned layers Electron induced chemical lithography can create ultra high resolution templates for the site selective immobilisation of molecules to form functional hierarchic
