

## Endocrine System Worksheet

1. What is the function of the endocrine system?

*The endocrine system produces and releases hormones which are chemical messengers that affect various tissues and organs of the body.*

2. What is a hormone?

*A hormone is a chemical messenger that regulates activities of tissues and organs in the body.*

3. How does the negative-feedback mechanism work?

*Negative-feedback is the method used by the endocrine system to regulate the level of hormones in the blood. Certain glands can detect how much of a given hormone is present in the blood. Based on this information, either the signal to create more or stop releasing that hormone is given.*

4. How do the hormones released by the endocrine glands get around the body?

*The hormones travel throughout the body by way of the circulatory system. Each hormone has certain target cells located in various tissues or organs of the body. When a target cell detects the hormone in the blood, the cell absorbs the hormone.*

5. Two of the hormones secreted by the pancreas are insulin and glucagon. These hormones work together to maintain a balanced blood sugar level. How do they do that?

*Insulin is a chemical that helps cells convert sugar into energy. It decreases the sugar level in the blood. Glucagon does the opposite of insulin. It increases the blood sugar level by stimulating the conversion of stored sugar.*
