The Impact of Bodily Experience on Paul's Resurrection Theology Kai-Hsuan Chang, 2021-09-23 Kai Hsuan Chang engages with the longstanding scholarly debate concerning the development of Paul's resurrection theology by investigating the correlation between his bodily experiences and his diverse articulations about resurrection. Drawing on insights from cognitive linguistics, Chang considers Paul's ideas about resurrection as fundamentally grounded in recurrent patterns of bodily experience, arguing that such experience of some religious activities in Paul's time—death rites, spirit possession, and baptism—contributed to the formation and development of his resurrection theology. Chang demonstrates that developments in Paul's ideas about bodily transformation at resurrection reflected in 1 Corinthians 15 resulted from a change in the experiential patterns on which his new idea is constructed, rather than transformation during heavenly ascent as seen in Jewish traditions of resurrection. He thus applies cognitive linguistic tools to two considerations: first, whether Paul had contextual reasons to generate his innovation in 1 Corinthians 15; and second, whether Paul's innovation recurred or had continual effects in Christian groups. In so doing, Chang shows that Paul's innovation directly addressed a contextual issue of death rites in Corinth and exerted a continuing effect on Paul's later ideas of transformation, spirit possession, and baptism.

Equations with Linear Algebra Matthew R. Boelkins, Jack L. Goldberg, Merle C. Potter, 2009-11-05 Linearity plays a critical role in the study of elementary differential equations linear differential equations especially systems thereof demonstrate a fundamental application of linear algebra In Differential Equations with Linear Algebra we explore this interplay between linear algebra and differential equations and examine introductory and important ideas in each usually through the lens of important problems that involve differential equations Written at a sophomore level the text is accessible to students who have completed multivariable calculus With a systems first approach the book is appropriate for courses for majors in mathematics science and engineering that study systems of differential equations Because of its emphasis on linearity the text opens with a full chapter devoted to essential ideas in linear algebra Motivated by future problems in systems of differential equations the chapter on linear algebra introduces such key ideas as systems of algebraic equations linear combinations the eigenvalue problem and bases and dimension of vector spaces This chapter enables students to quickly learn enough linear algebra to appreciate the structure of solutions to linear differential equations and systems thereof in subsequent study and to apply these ideas regularly The book offers an example driven approach beginning each chapter with one or two motivating problems that are applied in nature The following chapter develops the mathematics necessary to solve these problems and explores related topics further Even in more theoretical developments we use an example first style to build intuition and understanding before stating or proving general results Over 100 figures provide visual demonstration of key ideas the use of the computer algebra system Maple and Microsoft Excel are presented in detail throughout to provide further perspective and support students use of technology in solving problems Each chapter closes with several substantial projects for further study many of which are based in applications Errata sheet available at www.oup.com/us/companion websites 9780195385861 pdf errata pdf
