Adapt Amina Khan, 2017-04-18 Amina Khan believes that nature does it best In Adapt she presents fascinating examples of how nature effortlessly solves the problems that humans attempt to solve with decades worth of the latest and greatest technologies time and money Humans are animals too and animals are incredibly good at doing more with less If a fly's eye can see without hundreds of fancy lenses and termite mounds can stay cool in the desert without air conditioning it stands to reason that nature can teach us a thing or two about sustainable technology and innovation In Khan's accessible voice these complex concepts are made simple There is so much we humans can learn from nature's billions of years of productive and efficient evolutionary experience This field is growing rapidly and everyone from architects to biologists to nano technicians to engineers are paying attention Results from the simplest tasks creating Velcro to mimic the sticking power of a burr to the more complex like maximizing wind power by arranging farms to imitate schools of fish can make a difference and inspire future technological breakthroughs Adapt shares the weird and wonderful ways that nature has been working smarter and not harder and how we can too to make billion dollar cross industrial advances in the very near future

New Frontiers in Multiscale

Modelling of Advanced Materials Simone Taioli, Maurizio Dapor, Nicola M. Pugno, 2016-01-22 Atomistic simulations based on ab initio and semi empirical approaches are nowadays widespread in many areas of physics chemistry and more recently biology Improved algorithms and increased computational power widened the areas of application of these computational methods to extended materials of technological interest in particular allowing unprecedented access to the first principles investigation of their electronic optical thermodynamical and mechanical properties even where experiments are not

available However for a big impact on the society this rapidly growing field of computational approaches to materials science has to face the unfavourable scaling with the system size and to beat the time scale bottleneck Indeed many phenomena such as crystal growth or protein folding for example occur in a space time scale which is normally out of reach of present simulations Multi scale approaches try to combine different scale algorithms along with matching procedures in order to bridge the gap between first principles and continuum level simulations This Research Topic aims at the description of recent advances and applications in these two emerging fields of ab initio and multi scale materials modelling for both ground and excited states A variety of theoretical and computational techniques are included along with the application of these methods to systems at increasing level of complexity from nano to micro Crossing the borders between several computational theoretical and experimental techniques this Research Topic aims to be of interest to a broad community including experimental and theoretical physicists chemists and engineers interested in materials research in a broad sense
