Added Value of 3D Imaging in the Diagnosis and Prognostication of Patients with Right Ventricular Dysfunction Attila Kovacs, 2024-01-24 Right ventricular RV function has proven to be a prognostic factor in heart failure with reduced and preserved left ventricular ejection fraction or in pulmonary arterial hypertension RV function is also a cornerstone in managing relatively novel clinical issues such as mechanical circulatory support devices or grown up congenital heart diseases Despite the notable amount of circumferentially oriented myofibers in the subepicardial layer of the RV myocardium the non longitudinal motion directions are often neglected in the everyday assessment of RV function The complex RV contraction pattern however incorporates distinct mechanical components 3D imaging may enable capturing subtle RV dysfunction which can be undetectable by conventional methods Novel 3D based parameters may allow an earlier diagnosis and better risk stratification of numerous cardiac and primarily non cardiac diseases

modelling techniques to study specific CHD scenarios
