---	--

Photosynthesis is the process by which plants produce their own food in the presence of water, carbon dioxide, and sunlight. Photosynthesis occurs in the organelle called the chloroplasts that is found only in plants. Plants contain a green pigment known as chlorophyll, which is located in "pancake" shaped structures called thylakoids. Energy from the Sun excites electrons within the Photosystems. These charged-up electrons pass through the membrane to be picked up by the electron carrier ATP to form NADPH. Hydrogen ions pass through a protein, known as Glucose, to transform ADP into NADP+. Both the NADPH and ATP produce a carbohydrate called ATP synthase from carbon dioxide from the atmosphere. oxygen is released as a waste product.
