Investigation 3: Logistic Growth of an Elephant Population

For each investigation, you will complete data charts and a few short questions. This assignment will count as a lab grade, so be sure to do your very best work.

In this investigation, you are a Department of Natural Resources aquatic biologist assigned to study the ecology of Lake Madonna, a small lake in south central Wisconsin. Recently, a single adult zebra mussel was found in Lake Madonna. Citizens, government officials, and scientists are concerned about a large scale invasion of the lake by this pest.

1. Find out what the experts predict will happen about the zebra mussel population.

2. Collect data about the population for a period of 5 years.

3. Process the data and compare it with the models the experts propose.

In the space below, sketch the population graphs that illustrate the experts' predictions about the population.

Expert 1	Expert 2	Expert 3
Type of growth:	Type of growth:	Type of growth:

After you have sketched each graph, be sure to click "Next" after the last expert's prediction to move on to collect data. You will need to collect both qualitative and quantitative data.

Population Dynamics Three Types Of Population Growth Key:

Population Dynamics and Projection Methods John Stillwell, Martin Clarke, 2011-02-15 Although the human population growth rate of the world has been declining since peaking in the early 1960s the populations of individual countries are changing at different rates Population dynamics at national level are partly determined by levels of fertility and mortality but the impact of international migration is playing an increasingly important role Moreover internal migration plays a major part in population change at the sub national level This fourth volume in the series Understanding Population Trends and Processes is a celebration of the work of Professor Philip Rees It contains chapters by contributors who have collaborated with Phil Rees on research or consultancy projects or as postgraduate students Several chapters demonstrate the technical nature of population projection modelling and simulation methods while others illustrate issues relating to data availability and estimation This book demonstrates the application of theoretical and modelling methods and addresses key issues relating to contemporary demographic patterns and trends

Insect Populations In theory and in practice Jack P. Dempster, Ian F.G. McLean, 2012-12-06 Insects are by far the largest group of animals on Earth with over a million described species and they occupy a wide range of ecological niches they may be herbivores predators parasites or decomposers Some are of particular economic importance as pests of agriculture and forestry as vectors of animal and human disease or as species of interest to wildlife conservation Thus an understanding of the processes determining their numbers is of considerable practical value Entomologists have played a leading role in developing a theoretical basis to Population Ecology but we still do not have adequate experimental and observational proof for many of the theoretical ideas that have been proposed As a result the subject has been beset with arguments for more than 50 years This volume attempts to reconcile some of these controversies while also reviewing the current state of our knowledge The editors have drawn together an international list of contributors whose views reflect a range of opinions on how natural populations are stabilised They have succeeded in producing a book that both covers the main alternative views in population theory and contains some of the best recent field studies of insect populations This Royal Entomological Society Symposium volume will be of great interest to all entomologists and ecologists particularly those who wish to know more about Population Dynamics

Population Dynamics of Commercial Fish in Inland Reservoirs L.A. Kuderskii,2017-10-19 This text analyzes the structure of fish populations in inland reservoirs based on absolute values of their mass The structure of population and its changes have been examined in seven fish species from small lakes two from large lakes and seven from large reservoirs in plains Special attention has been paid to the main indicator of the structure of population correlation between the age of ichthyomass and mass maturation

Breininger, Doug P. Armstrong, Robert C. Lacy, James Nichols, 2025-04-09 Endangered Species Recovery planning is often based on predictions from population models Species recovery is contingent on habitat restoration including reduction of threats such as predators and parasites However population predictions are rarely linked to habitat management meaning that management cannot be easily guided by most formal decision making frameworks Predicted recovery trajectories may depend not only on the type and extent of restoration but also the timing For example populations may initially continue to decline as habitat restoration takes place and their genetic diversity might need to be maintained during that process There is also often considerable uncertainty about the effectiveness of proposed management in improving habitat quality and the effects of those improvements on population growth rates of the species targeted for recovery We seek examples of approaches integrating habitat restoration and population dynamics to guide decision making One example is where population data e g occupancy and habitat dynamics e g transition probabilities between states are directly integrated into a statistical likelihood Another uses a metamodel to combine different interdisciplinary models e g population habitat disease predator prey to represent a more complex system integrating the flow of information and sequences of events among models Decision frameworks to enhance species recovery could include management of relatively natural areas but also more intensively managed areas such as zoos or fragmented landscape with minimal long term conservation potential for some species Decision frameworks will ideally include adaptive management i e re current decisions recognizing that conservation decisions often need to begin imminently and that delaying action is a decision We invite articles that include several of the following elements in the context of conservation decision making Explaining why it is important to consider animal or plant population and habitat dynamics together Case studies models or other demonstrations of how habitat and population dynamics should or can be linked Examples may include remnant populations but also recent or prospective translocations Explicit or decision making approaches including adaptive management for linking habitat and populations for conservation to guide conservation Showing how loss of genetic variation in small populations can affect decisions given the time needed to restore habitat reduced toxins introduced predators disease Showing how variation in population and habitats over time and or space are important for decisions about species recovery *Local Economic and Employment Development (LEED) Demographic Change and Local Development Shrinkage, Regeneration and Social Dynamics* Martinez-Fernandez Cristina, Kubo Naoko, Noya Antonella, Weyman Tamara, 2012-11-28 This report highlights the issues faced by local areas against the

Vandermeer, Deborah E.

Goldberg, 2013-08-25 The essential introduction to population ecology now expanded and fully updated Ecology is capturing the popular imagination like never before with issues such as climate change species extinctions and habitat destruction becoming ever more prominent At the same time the science of ecology has advanced dramatically growing in mathematical and theoretical sophistication Here two leading experts present the fundamental quantitative principles of ecology in an accessible yet rigorous way introducing students to the most basic of all ecological subjects the structure and dynamics of populations John Vandermeer and Deborah Goldberg show that populations are more than simply collections of individuals Complex variables such as distribution and territory for expanding groups come into play when mathematical models are applied Vandermeer and Goldberg build these models from the ground up from first principles using a broad range of empirical examples from animals and viruses to plants and humans They address a host of exciting topics along the way including age structured populations spatially distributed populations and metapopulations This second edition of Population Ecology is fully updated and expanded with additional exercises in virtually every chapter making it the most up to date and comprehensive textbook of its kind Provides an accessible mathematical foundation for the latest advances in ecology Features numerous exercises and examples throughout Introduces students to the key literature in the field The essential textbook for advanced undergraduates and graduate students An online illustration package is available to professors

Eco-Evolutionary Dynamics Andrew P. Hendry, 2016-11-22 In recent years scientists have realized that evolution can occur on timescales much shorter than the long lapse of ages emphasized by Darwin in fact evolutionary change is occurring all around us all the time This book provides an authoritative and accessible introduction to eco evolutionary dynamics a cutting edge new field that seeks to unify evolution and ecology into a common conceptual framework focusing on rapid and dynamic environmental and evolutionary change Andrew Hendry covers key aspects of evolution ecology and their interactions Topics range from natural selection adaptive divergence ecological speciation and gene flow to population and community dynamics ecosystem function plasticity and genomics Hendry evaluates conceptual and methodological approaches and draws on empirical data from natural populations including those in human disturbed environments to tackle

a number of classic and emerging research questions He also discusses exciting new directions for future research at the intersection of ecology and evolution An invaluable guide for students and researchers alike Eco evolutionary Dynamics reveals how evolution and ecology interact strongly on short timescales to shape the world we see around us Political Economy of Europe Hardy Hanappi, 2021-11-29 The development of European unification has reached a critical stage Despite 75 years of peace increases in welfare and growth since World War 2 there is now a growing scepticism of the European agenda from various quarters most notably embodied in the exit of the United Kingdom from the European Union To fully understand the dynamics at work this book presents an introduction to the development of the political economy of Europe from 1900 to 2020 The first part of the book provides an overview of European economic and political history from 1900 to the present It is clear from this history that Europe's population and most notably its leaders have been deeply influenced by ideology during this time This sets the context for the second part of the book which takes a closer look at some major paradigms framing European dynamics 1 the market oriented paradigm 2 Marx's paradigm and 3 the fascist paradigm In this part the essential core of each of these paradigms is presented and critiqued In the third part the current bottlenecks of European evolution the migration crisis Brexit rise of new Fascism the climate crisis the COVID 19 pandemic are investigated in the light of a possible emergence of a new scientific paradigm Europe's role in the global division of labour its possibility to serve as a role model for the advantages of democratically governing a highly diverse set of populations is also explained This book is an ideal text for students undertaking courses on the political economy of Europe in either economics or politics departments
