

2004 BRAKES**Anti-Lock Braking System (ABS) - Endeavor****GENERAL DESCRIPTION****FEATURES**

The 4ABS ensures directional stability and control during hard braking.

This ABS uses a 4-sensor 4-channel system that controls all four wheels independently of each other. The basic system is the same as that for the Lancer.

- EBD (Electronic Brake-force Distribution system) control has been installed to provide the ideal braking force for the rear wheels.

EBD CONTROL

In ABS, electronic control is used so the rear wheel brake hydraulic pressure during braking is regulated by rear wheel control solenoid valves in accordance with the vehicle's rate of deceleration. The front and rear wheel slippages are calculated from the signals received from the various wheel sensors. EBD control is a control system which provides a high level of control for both vehicle braking force and vehicle stability. The system has the following features:

- To shorten the harness wires and enhance data transmission reliability, communication with other ECU is performed over a CAN (Controller Area Network).
- Fail-safe function ensures that safety is maintained.
- Diagnostic function provides improved serviceability.
- Because the system provides the optimum rear wheel braking force regardless of vehicle load and the condition of the road surface, the system reduces the required pedal depression force, particularly when the vehicle is heavily loaded.
- Because the duty placed on the front brakes is reduced, the increases in pad temperature can be controlled during front brake application to improve pad wear.
