

PIGEON DISSECTION

INTRODUCTION: The bird is a vertebrate whose body plan is adapted to its requirements for flight. For example, the skeletal system is lightweight and very strong. The flight muscles of the chest may make up one fifth of the total mass of a bird's body. Birds have extremely great energy requirements because of their high metabolic rate. The unique air sacs of their respiratory system provide them with a continuous supply of oxygen. In line with their needs for a streamlined, lightweight body, birds' reproductive organs are small and inactive for most of the year. During the breeding season, however, the male and the female reproductive organs increase greatly in size.

PURPOSE: In this investigation, you will be exploring some of the unique structural features of a bird through a dissection.

MATERIALS NEEDED: preserved specimen /probe/dissecting tray/forceps/scissors/hand lens/scalpel

PROCEDURE:

EXTERNAL OBSERVATIONS

1. Obtain a preserved bird and rinse it with tap water. Place the ventral side up in a dissecting tray. Spread out one wing to that the various types of feathers are visible.
 - Use your "**Bird Feather Types, Anatomy, Growth, Color, and Molting**" reference worksheet as a guide to study the anatomy of your pigeon's feathers.
2. Pull out one of the primary feathers and examine it with a hand lens. Locate the long, slender, hollow **SHAFT**. From the shaft, you will note that barbs extend outward at an angle of about 45 degrees. With your fingers, gently pull apart the barbs. Notice that they are formed of still smaller **BARBULES** with interlocking hooks. Examine the barbs and the barbules with your hand lens.
