| (3) Brake Cam Lever LH | (6) Steel Ball | (9) Differential Gear Shaft | |

The brake body is incorporated in the differential side cover filled with transmission oil and is designed to brake when the brake disk (4) splined with the differential gear shaft (9) is pressed against the cam plate (7) by means of the cam mechanism incorporating steel balls (6).

For greater braking force, two brake disks are provided at the right and left sides respectively, and the friction plate (8) fixed to the rear axle case is arranged between the brake disks.

■ During Braking

When brake oil pressure increases, the brake piston (2) is shortened, the linkage causes the brake cam levers (3), (5) to turn into the direction of arrow shown in the above figure.

Therefore, the cam plate (7) also moves the direction of arrow. At this time, since the cam plate rides on the steel balls (6) set in the grooves of the bearing holder (10) to press the brake disk (4), the differential gear shaft (9) is braked by the frictional force generated by the cam plate (7) and brake disk (4).
