The Pregel platform provides the programmer with a single environment for graphlet (G), classical (C), and graphlet-centric (GCG) algorithms (GCGs, GCGs, and GCGs), as well as quantitative information and GCG-centric workflows.

**Advanced edge detection**, such as the new curvature-curvature and curvature-slope atomic attributes in the Peierls platform, provides a clear delineation of complex structures, such as complex faulting of in situ and growth zones. Through interactive geometrical/atomic reconstruction, tertiary and depositional relationships can be investigated. The modelling-attribute-interpreting capabilities help deliver a consistent validated structural framework of the subsurface that can be used directly to fracture mapping, and well and geophysical workflows.

Multiscale attribute analysis and volume-based visualization is the fastest way to interrogate and analyze your data when determining subtle morphologic features. The Petrel platform improves productivity and visualization using the latest GPU technology. Advanced volume attributes, such as Generalized Spectral Decomposition, are generated on the fly and blended using the MIPMap tool in real 32-bit color. Parameters are fine-tuned using interactive and dynamic controls for instant updates. Geological bodies are isolated and extracted from the seismic, and can be directly compiled into the model and used directly in seismic distribution.

**Abstract**

The **Partial Quantitative Interpretation** module provides a comprehensive range of advanced, intuitive, and interactive tools to estimate network properties, all in the same interpretation window.

Geoscientists can automatically visualize, process, and interpret geospatial data; perform various data conditioning; perform accurate terrain-surface calibration; perform detailed rock physics, RFT, or AFT analysis with 3D cross-plating capabilities; and perform geospatial and geospatial deterministic and stochastic simulation. In Petrel 2015, technology-identification rules (as well as associated workflow rules) can be incorporated directly from the processing results.

### Comments, Corrections, Revisions

The Forest platform allows access to geospatial data and multi-2 integration, that streamlines the depth imaging workflow between the Omega and Forest platforms.

In April 2015, the new interactive mesh editing tools provide the ability to interactively modify the triangulated mesh surface, representing the cell walls generated from the multi-C simulations to form a realistic model.

**Important Note:** Editing and allowing is subject to construction and must follow the specific criteria established in the specific contract.

**Any geophysical work** – from classic map-based interpretation to advanced quantitative interpretation (e.g. 3D workflows) – performed using the Petrol platform can be automatically used by other disciplines, such as petroleum systems evaluation, subsurface modelling, and reservoir simulation.
