Final Report of the Committee on a Strategic Plan for U.S. Burning Plasma Research

National Academies of Sciences, Engineering, and Medicine,Division on Engineering and Physical Sciences,Board on Physics and Astronomy,Committee on a Strategic Plan for U.S. Burning Plasma Research,2019-05-31 Fusion offers the prospect of virtually unlimited energy The United States and many nations around the world have made enormous progress toward achieving fusion energy With ITER scheduled to go online within a decade and demonstrate controlled fusion ten years later now is the right time for the United States to develop plans to benefit from its investment in burning plasma research and take steps to develop fusion electricity for the nation s future energy needs At the request of the Department of Energy the National Academies of Sciences Engineering and Medicine organized a committee to develop a strategic plan for U S fusion research The final report s two main recommendations are 1 The United States should remain an ITER partner as the most cost effective way to gain experience with a burning plasma at the scale of a power plant 2 The United States should start a national program of accompanying research and technology leading to the construction of a compact pilot plant that produces electricity from fusion at the lowest possible capital cost Interim Report of the Committee on a Strategic Plan for U.S. Burning Plasma Research National Academies of Sciences, Engineering, and Medicine,Division on Engineering and Physical Sciences,Board on Physics and Astronomy,Committee on a Strategic Plan for U.S. Burning Plasma Research,2018-03-19 In January 2003 President George W Bush announced that the United States would begin negotiations to join the ITER project and noted that if successful ITER would create the first fusion device capable of producing thermal energy comparable to the output of a power plant making commercially viable fusion power available as soon as 2050 The United States and the other ITER members are now constructing ITER with the aim to demonstrate that magnetically confined plasmas can produce more fusion power than the power needed to sustain the plasma This is a critical step towards producing and delivering electricity from fusion energy Since the international establishment of the ITER project ITER s construction schedule has slipped and ITER s costs have increased significantly leading to questions about whether the United States should continue its commitment to participate in ITER This study will advise how to best advance the fusion energy sciences in the United States given developments in the field the specific international investments in fusion science and technology and the priorities for the next ten years developed by the community and the Office of Fusion Energy Sciences FES that were recently reported to Congress It will address the scientific justification and needs for strengthening

the foundations for realizing fusion energy given a potential choice of U S participation or not in the ITER project and develops future scenarios in either case This interim report assesses the current status of U S fusion research and of the importance of burning plasma research to the development of fusion energy as well as to plasma science and other science and engineering disciplines The final report will present strategies that incorporate continued progress toward a burning plasma experiment and a focus on innovation
