Light itself is characterized as a stream or ray that travels in straight lines if the case of "unobstructed propagation" unless broken by reflection or refraction. Light rays travelling in this medium but a like transparent medium is different medium, part of it is reflected back into the same medium (according to the law of reflection) (2) the other part that is also transparent part of the light will enter that medium, but the other half change. This process is called as the process of refraction. However this law of refraction.

Law of Reflection - the same principle, stating that when a light ray strikes a mirror, the angle of incidence, θ_i , is equal to the angle of reflection, θ_r . The light ray is measured from the normal, the line off the surface. This is true for all surfaces, curved surfaces which light rays encounter at small angles, such as the lens of your eye. If the incident is normal, or vertical, then the reflected ray is vertical, as well. (The reflected ray may either converge to a point or diverge, as in the case of a reflecting surface, such as a mirror.)
