Lab Activity 3 Questions:

1. Examine your data. Comparing your first two populations, with and without predation, how did predation influence the population?

Predation caused the second population to be extremely different from the first. As a result of this predation, the fur color frequency to be 100% for the light brown fur, the RLRL genotype frequency to be 100%, and the RL allele frequency to be 100%. This means that because of predation, the RL phenotype/genotype/allele became the homozygous dominant gene.

2. Based on your observations, did mutation affect the population over time? How?

Mutations caused another shift in the third population, as it restored some percentage to the medium and dark fur colors, RLRD, RDRL, and RDRD genotype frequencies, and RD allele frequency. In the third population, it seem to have a greater effect on the heterozygous genotypic frequency, as it ended up with 44% compared to the RLRLs 29%. So, while predation had the greatest effect on the homozygous dominant (LL) gene, mutation seemed to have the greatest effect on the heterozygous (LD) gene.
