

A group of 78 third-grade students in a midwestern elementary school took a "self-concept" test that measured how well they felt about themselves. Higher scores indicate more positive self-concepts. A histogram and some summary statistics from Minitab for these students' self-concept scores are given below.

Descriptive Statistics: SelfConcept

Variable	N	Mean	Median	TrMean	StDev	SE Mean
SelfConcept	78	56.96	59.50	57.81	12.41	1.41
Variable	Minimum	Maximum	Q1	Q3		
SelfConcept	20.00	80.00	51.00	66.25		

1. Draw an appropriate density curve for summarizing the histogram on the graph above. How would you describe the shape of this density curve?

skewed left

2. One student in the group had a self-concept score of 62. Thirty-four students had self-concept scores higher than 62. Describe the location of this value within the distribution using raw data, percentiles, and standardized values (z-scores).

score of 62 : $\frac{44}{78} = 56.4\%$ percentile

$z = \frac{62 - 56.96}{12.41} \approx 0.41 \rightarrow$ about 0.41 standard deviations above the mean

3. What is a "typical" self-concept score for a third-grader in this group? Justify your answer.

59.5 → use the median in a skewed distribution to measure the center because it is more resistant to extreme observations

Learning from failure Falco Dürsch, Patrick Rein, Toni Mattis, Robert Hirschfeld, 2023-03-15 Regression testing is a widespread practice in today's software industry to ensure software product quality Developers derive a set of test cases and execute them frequently to ensure that their change did not adversely affect existing functionality As the software product and its test suite grow the time to feedback during regression test sessions increases and impedes programmer productivity developers wait longer for tests to complete and delays in fault detection render fault removal increasingly difficult Test case prioritization addresses the problem of long feedback loops by reordering test cases such that test cases of high failure probability run first and test case failures become actionable early in the testing process We ask given test execution schedules reconstructed from publicly available data to which extent can their fault detection efficiency improved and which technique yields the most efficient test schedules with respect to APFD To this end we recover regression 6200 test sessions from the build log files of Travis CI a popular continuous integration service and gather 62000 accompanying changelists We evaluate the efficiency of current test schedules and examine the prioritization results of state of the art lightweight history based heuristics We propose and evaluate a novel set of prioritization algorithms which connect software changes and test failures in a matrix like data structure Our studies indicate that the optimization potential is substantial because the existing test plans score only 30% APFD The predictive power of past test failures proves to be outstanding simple heuristics such as repeating tests with failures in recent sessions result in efficiency scores of 95% APFD The best performing matrix based heuristic achieves a similar score of 92.5% APFD In contrast to prior approaches we argue that matrix based techniques are useful beyond the scope of effective prioritization and enable a number of use cases involving software maintenance We validate our findings from continuous integration processes by extending a continuous testing tool within development environments with means of test prioritization and pose further research questions We think

that our findings are suited to propel adoption of continuous testing practices and that programmers toolboxes should contain test prioritization as an existential productivity tool Federal Government Paperwork: Part I United States.
