Global Positioning System-controlled Thermostat System Manu Gupta (S. M.), 2008 Using 10 weeks of data from a couple living in an instrumented home we report on the potential of context aware power management for energy saving We identify an opportunity to save on heating and cooling using a system we propose for just in time heating and cooling based on travel distance computation from GPS enabled mobile phones Analyzing GPS travel data from eight participants 8 12 weeks each and heating and cooling characteristics from 4 homes we report results of running computer simulations estimating potential energy savings of a system that could augment existing manual and programmable thermostats Although manual and programmable thermostats can save large amounts of energy when used properly studies have shown that well over 40% of U S homes may not use energy saving setbacks when homes are unoccupied We estimate that using a GPS enabled thermostat might lead to savings of as much as 7% for some households that do not regularly use the setback features afforded by manual and setback thermostats without requiring any change in behavior For some end users providing one extra bit of information each day could lead to savings as high as 9% and additional persuasive strategies could save up to 15% We then report on the implementation of a prototype system and pilot testing of the user interface We propose five design guidelines for a just in time heating and cooling system Thermostat Interface and Usability, 2010 This report investigates the history of thermostats to better understand the context and legacy regarding the development of this important tool as well as thermostats relationships to heating cooling and other environmental controls We analyze the architecture interfaces and modes of interaction used by different types of thermostats For over sixty years home thermostats have translated occupants temperature preferences into heating and cooling system operations In this position of an intermediary the millions of residential thermostats control almost half of household energy use which corresponds to about 10percent of the nation s total energy use Thermostats are currently undergoing rapid development in response to emerging technologies new consumer and utility demands and declining manufacturing costs Energy efficient homes require more careful balancing of comfort energy consumption and health At the same time new capabilities will be added to thermostats including scheduling control of humidity and ventilation responsiveness to dynamic electricity prices and the ability to join communication networks inside homes Recent studies have found that as many as 50percent of residential programmable thermostats are in permanent hold status Other evaluations found that homes with programmable thermostats consumed more energy than those relying on manual thermostats Occupants find thermostats cryptic and baffling to operate because manufacturers often rely on obscure and sometimes even contradictory terms symbols procedures and icons It appears that many people are unable to fully exploit even the basic features in today s programmable thermostats such as setting heating and cooling schedules It is important that people can easily reliably and confidently operate thermostats in

their homes so as to remain comfortable while minimizing energy use

Facilitating Energy Savings Through Enhanced Usability of Thermostats, 2011 Residential thermostats play a key role in controlling heating and cooling systems. Occupants often find the controls of programmable thermostats confusing, sometimes leading to higher heating consumption than when the buildings are controlled manually. A high degree of usability is vital to a programmable thermostat's effectiveness because unlike a more efficient heating system, occupants must engage in specific actions after installation to obtain energy savings. We developed a procedure for measuring the usability of thermostats and tested this methodology with 31 subjects on five thermostats. The procedure requires first identifying representative tasks associated with the device and then testing the subjects' ability to accomplish those tasks. The procedure was able to demonstrate the subjects' wide ability to accomplish tasks and the influence of a device's usability on success rates. A metric based on the time to accomplish the tasks and the fraction of subjects actually completing the tasks captured the key aspects of each thermostat's usability. The procedure was recently adopted by the Energy Star Program for its thermostat specification. The approach appears suitable for quantifying usability of controls in other products such as heat pump water heaters and commercial lighting.
