SAITO FA-130T

By Clarence Lee

for this month.

It is a proven fact that with our smaller displacement model engines, a single cylinder engine will develop more power than an equivalent displacement twin; more so with a 2-stroke engine than with a 4-stroke. This is due mainly to the additional

power spread between a single cylinder and twin cylinder engine considerably closer. However, things are a bit different with the Saito FA-130 twin in that a single throw crankshaft is used with both cylinder and rod assemblies connected to the same crank pin which results in a

If you take two .65 cubic inch displacement single cylinder 4-stroke engines noted for their high level of performance and join them together with a common crankcase and crankshaft, what do you have? You're right—a real strong running 1.3 cubic inch displacement 4-stroke twin. This is basically what Saito has done with their FA-130 twin, the subject of our engine review

parts required and an increase in the frictional drag, although other factors also enter the picture. A single cylinder 4-stroke engine has one power stroke every other revolution of the crankshaft so that there is a bit of "slow down" time between power strokes. An alternate fire 4-stroke twin, on the other hand, has a power stroke every revolution of the crankshaft which tends to make the

rather unorthodox firing sequence. When viewed from the rear, the left hand cylinder fires, the crankshaft rotates 180° and the right hand cylinder fires, then the crankshaft rotates a turn and a half (540°) and the sequence starts again. Even with this unusual firing sequence, the engine is a real powerhouse running right with the more powerful of the single cylinder 1.2 cubic inch 4-stroke

Sumiyoshi, Kenji Hashimoto, 2019-11-25 Disturbances of various domains of cognitive function have been shown to provide a major determinant of outcome for patients with psychiatric conditions. Cognitive impairment is present in an array of diseases including schizophrenia with its prodromal stage, mood disorder, autism spectrum disorder, obsessive compulsive disorder, anxiety disorder, post-traumatic disorder, and eating disorder. In an effort to develop effective therapeutics for cognitive impairment, bridging of preclinical and clinical evidence has been attempted. This edited Book will provide a forum for researchers and clinicians interested in the phenomenology, underlying mechanisms, and treatment of cognitive impairment associated with psychiatric illnesses. Twenty-eight contributions from 8 countries in Europe, Middle East, Asia, North America, and South America represent studies dealing with genetic, molecular, imaging, physiological, psychological, and behavioral issues. Information in this Book will facilitate the development of therapeutics of greater clinical value. Broken Movement

John W. Krakauer, S. Thomas Carmichael, 2017-11-16 An account of the neurobiology of motor recovery in the arm and hand after stroke by two experts in the field. Stroke is a leading cause of disability in adults, and recovery is often difficult with existing rehabilitation therapies largely ineffective. In Broken Movement, John Krakauer and S. Thomas Carmichael, both experts in the field, provide an account of the neurobiology of motor recovery in the arm and hand after stroke. They cover topics that range from behavior to physiology to cellular and molecular biology. Broken Movement is the only accessible single volume work that covers motor control and motor learning as they apply to stroke recovery and combines them with motor cortical physiology and molecular biology. The authors cast a critical eye at current frameworks and practices, offer new recommendations for promoting recovery, and propose new research directions for the study of brain repair. Krakauer and Carmichael discuss such subjects as the behavioral phenotype of hand and arm paresis in human and non-human primates, the physiology and anatomy of the motor system after stroke, mechanisms of spontaneous recovery, the time course of early recovery, the challenges of chronic stroke, and pharmacological and stem cell therapies. They argue for a new approach in which patients are subjected to higher doses and intensities of rehabilitation in a more dynamic and enriching environment early after stroke. Finally, they review the potential of four areas to improve motor recovery: video gaming and virtual reality, invasive brain stimulation, re-opening the sensitive period after stroke, and the application of precision medicine.
