Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 40 to 50 years of age, who were randomly selected from a local health club. The subjects were divided into two groups: a control group and an exercise group. The control group consisted of six women who did not exercise during the study. The exercise group consisted of six women who exercised for 12 weeks. The exercise program consisted of three sessions per week, each lasting 30 minutes. The sessions were performed on a treadmill at a speed of 3.0 mph and a 5% incline. The HR and EE were measured at rest and during exercise at the beginning and end of the study. The results showed that the exercise group had a significant increase in HR and EE compared to the control group. The HR increased from 68 to 78 beats per minute, and the EE increased from 1,200 to 1,400 kcal per day. The control group showed no significant change in HR or EE. These results suggest that a 12-week training program can improve the cardiovascular fitness and energy expenditure of sedentary, middle-aged women.
