Solving Diophantine Equations Octavian Cira, Florentin Smarandache, 2014 In this book a multitude of Diophantine equations and their partial or complete solutions are presented How should we solve for example the equation $x \cdot x$ where x is the Smarandache function and is Riemann function of counting the number of primes up to x in the set of natural numbers If an analytical method is not available an idea would be to recall the empirical search for solutions We establish a domain of searching for the solutions and then we check all possible situations and of course we retain among them only those solutions that verify our equation In other words we say that the equation does not have solutions in the search domain or the equation has n solutions in this domain This mode of solving is called partial resolution Partially solving a Diophantine equation may be a good start for a complete solving of the problem The authors have identified 62 Diophantine equations that impose such approach and they partially solved them For an efficient resolution it was necessary that they have constructed many useful tools for partially solving the Diophantine equations into a reasonable time The computer programs as tools were written in Mathcad because this is a good mathematical software where many mathematical functions are implemented Transposing the programs into another computer language is facile and such algorithms can be turned to account on other calculation systems with various processors

Nine Solved and Nine Open Problems in Elementary Geometry Florentin Smarandache , In this paper we review nine previous proposed and solved problems of elementary 2D geometry 4 and 6 and we extend them either from triangles to polygons or polyhedrons or from circles to spheres from 2D space to 3D space and make some comments conjectures and open questions about them
