Antimicrobial Peptides and Complement - Maximising the Inflammatory Response Cordula M. Stover, 2015-12-18

Antimicrobial peptides and complement are distinct components of the innate immune defence While antimicrobial peptides after cleavage of a preproprotein have the ability to insert directly in non host membranes complement requires a sequential enzymatic activation in the fluid phase in order to produce a transmembrane membrane attack complex Its insertion is controlled by membrane bound regulators Deficiencies are described for both effectors and relate to increased susceptibility of infection In addition however antimicrobial peptides and complement each influence the activity of inflammatory cells as recent data in the respective research areas shows This series of articles draws together for the entities of antimicrobial peptides and complement a balance of contributions in the areas of evolution roles functions and preclinical applications By comparing and contrasting antimicrobial peptides and complement greater cross disciplinary appreciation will be derived for their individual and overlapping spectra of activity circumstances of activation and their general ability to more completely inform the inflammatory and cellular response Risk Assessment and Evaluation of Predictions Mei-Ling Ting Lee, Mitchell

Lakey,2011-01-11 Formation of transmembrane pores is a very effective way of killing cells It is thus not surprising that many bacterial and eukaryotic toxic agents are pore forming proteins Pore formation in a target membrane is a complex process composed of several steps proteins need to attach to the lipid membrane possibly aggregate in the plane of the membrane and finally form a pore by inserting part of the polypeptide chain across the lipid bilayer Structural information about toxins at each stage is indispensable for the biochemical and molecular biological studies that aim to derstand how pores are formed at the molecular level There are currently only two Staphylococcus aureus and hemolysin E from Escherichia coli Therefore what we know about these proteins was obtained over many years of intense experimentation We have nevertheless in the last couple of years witnessed a significant rise in structural information on the soluble forms of pore forming proteins Surprisingly many unexpected similarities with other proteins were noted despite extremely low or insignificant sequence similarity It appears that lipid membrane binding and formation of transmembrane channels is achieved in many cases by a limited repertoire of structures This book describes how several of the important pore forming toxin families achieve membrane bi ing and which structural elements are used for formation of transmembrane pores Our contributors have thus provided the means for a comparative analysis of several unrelated families **Handbook of Radiopharmaceuticals** Michael R.
