Computational Biology and Applied Bioinformatics Heitor Lopes, Leonardo Magalhães Cruz, 2011-09-02 Nowadays it is difficult to imagine an area of knowledge that can continue developing without the use of computers and informatics It is

not different with biology that has seen an unpredictable growth in recent decades with the rise of a new discipline bioinformatics bringing together molecular biology biotechnology and information technology More recently the development of high throughput techniques such as microarray mass spectrometry and DNA sequencing has increased the need of computational support to collect store retrieve analyze and correlate huge data sets of complex information On the other hand the growth of the computational power for processing and storage has also increased the necessity for deeper knowledge in the field The development of bioinformatics has allowed now the emergence of systems biology the study of the interactions between the components of a biological system and how these interactions give rise to the function and behavior of a living being This book presents some theoretical issues reviews and a variety of bioinformatics applications For better understanding the chapters were grouped in two parts In Part I the chapters are more oriented towards literature review and theoretical issues Part II consists of application oriented chapters that report case studies in which a specific biological problem is treated with bioinformatics tools

Classification, Evolution, and the Nature of Biology Alec L. Panchen, 1992-06-26 Historically naturalists who proposed theories of evolution including Darwin and Wallace did so in order to explain the apparent relationship of natural classification This book begins by exploring the intimate historical relationship between patterns of classification and patterns of phylogeny However it is a circular argument to use the data for classification Alec Panchen presents other evidence for evolution in the form of a historically based but rigorously logical argument This is followed by a history of methods of classification and phylogeny reconstruction including current mathematical and molecular techniques The author makes the important claim that if the hierarchical pattern of classification is a real phenomenon then biology is unique as a science in making taxonomic statements This conclusion is reached by way of historical reviews of theories of evolutionary mechanism and the philosophy of science as applied to biology The book is addressed to biologists particularly taxonomists concerned with the history and philosophy of their subject and to philosophers of science concerned with biology It is also an important source book on methods of classification and the logic of evolutionary theory for students professional biologists and paleontologists
