"Disruption of Genetic Equilibrium"

- 5. Natural Selection- Genetic equilibrium requires the absence of natural selection.
- Figure 16-7, pg 307!!!
 - Stabilizing Selection - individuals with the average form of a trait have the highest fitness.
 - Directional Selection – individuals that display a more extreme form of a trait have a greater fitness than individuals with an average form of the trait.
 - Disruptive Selection - individuals with either an extreme variation of a trait have a greater fitness than individuals with an average form of the trait.

Modern Biology Towle, Albert Towle, 1991 **Formal Models of Domestic Politics** Scott Gehlbach, 2013-04-08

Formal Models of Domestic Politics offers the first unified and accessible treatment of canonical and important new formal models of domestic politics. Intended for students in political science and economics who have already taken a course in game theory, the text covers eight classes of models: electoral competition under certainty and uncertainty, special interest politics, veto players, delegation, coalitions, political agency, and regime change. Political economists, comparativists, and Americanists alike will find models here central to their research interests. The text assumes no mathematical knowledge beyond basic calculus, with an emphasis placed on clarity of presentation. Political scientists will appreciate the simplification of economic environments to focus on the political logic of models; economists will discover many important models of politics published outside of their discipline; and both instructors and students will value the numerous classroom-tested exercises.

Brazelton, 2025-05-27 The role of deeply buried microbes is far more important than has been previously presumed. Comprehensive studies of deep subsurface microbiology have revealed not only cell abundances that match previous estimates in surface environments but most importantly have demonstrated the viability of these microbes and their essential roles in operating and maintaining global biogeochemical cycles. The deep subsurface biosphere refers to the vast ecosystems of microorganisms that exist within marine subseafloor sediments and the oceanic crust as well as continental subterranean environments. They are estimated to contain a significant portion of the total biomass on Earth and are comprised of diverse microbial taxa including bacteria, archaea, protists, and fungi that survive in environments that are often extremely energy limited. Due to the unique characteristics of these ecosystems, deep subsurface microorganisms are often distinct from those found in surface environments and laboratory strains. They are becoming a crucial topic of research for their unusual adaptations to energy limitation and their important interactions with the geosphere. Despite its size and significance, however, the deep biosphere remains largely understudied. One of the main gaps in our knowledge is the extent of microbial biogeochemical activity across the physicochemical gradients that characterize deep biosphere extreme

ecosystems This is due in large part to the high uncertainty in metabolic rate estimates and unknown systematic biases due to data scarcity Bioenergetic studies have provided a conceptual framework for understanding the complexity of microbial metabolism within various spatial and temporal scales However our knowledge of energy metabolism in the deep biosphere is hindered by inadequate methodology for energy flux quantification and incomplete data of the actual energy parameters associated with subsurface microbes many of which are novel and uncharacterized species Despite these gaps research on the deep biosphere continues to provide new insights into the function of these unique microbial communities and their potential to reach and impact the chemical economy of the overlying ecosystems The aim of this Research Topic is to open a new perspective on the biotic abiotic interface in extreme microbiology We invite contributions from scientists working in diverse disciplines who have a common interest in various aspects of the study of microorganisms that live in energy limited deep subsurface environments This can include research on the diversity activity genetic repertoire and expression of subsurface microbial communities and their resulting biogeochemical activity We encourage the submission of manuscripts focusing on recent advances in deep biosphere studies by using both empirical and theoretical approaches Articles in this Research Topic are dedicated to commemorating the late Jan Amend whose pioneering work significantly advanced our understanding of microbial life in deep subsurface environments Amend s contributions not only challenged existing notions about the limits of life but also provided key insights into the survival strategies of microbes in energy limited settings continuing to inspire and guide current research in extreme microbiology
