Abstract—The purpose of this study was to determine the effect of a 10-week, 30-min, 3 times per week, supervised aquatic exercise program on the physical fitness of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were randomly assigned to an aquatic exercise group or a control group. The aquatic exercise group performed a 10-week, 30-min, 3 times per week, supervised aquatic exercise program. The control group performed no exercise. The subjects were assessed for physical fitness at baseline and at 10 weeks. The aquatic exercise group showed significant improvements in physical fitness compared to the control group. The improvements were seen in all measures of physical fitness, including cardiovascular fitness, muscular strength, and flexibility. The improvements were also seen in measures of body composition, including body weight, body fat, and lean body mass. The improvements were also seen in measures of health-related quality of life, including physical function, mental health, and overall health. The results of this study suggest that a 10-week, 30-min, 3 times per week, supervised aquatic exercise program can improve the physical fitness of sedentary, middle-aged women.
