The Runes of Evolution Simon Conway Morris, 2015-06-30 How did human beings acquire imaginations that can conjure up untrue possibilities How did the Universe become self aware In *The Runes of Evolution* Simon Conway Morris revitalizes the study of evolution from the perspective of convergence providing us with compelling new evidence to support the mounting scientific view that the history of life is far more predictable than once thought A leading evolutionary biologist at the University of Cambridge Conway Morris came into international prominence for his work on the Cambrian explosion especially fossils of the Burgess Shale and evolutionary convergence which is the process whereby organisms not closely related not monophyletic independently evolve similar traits as a result of having to adapt to similar environments or ecological niches In *The Runes of Evolution* he illustrates how the ubiquity of convergence hints at an underlying framework whereby many outcomes not least brains and intelligence are virtually guaranteed on any Earth like planet Conway Morris also emphasizes how much of the complexity of advanced biological systems is inherent in microbial forms By casting a wider net *The Runes of Evolution* explores many neglected evolutionary questions Some are remarkably general Why for example are convergences such as parasitism carnivory and nitrogen fixation in plants concentrated in particular taxonomic hot spots Why do certain groups have a particular propensity to evolve toward particular states Some questions lead to unexpected evolutionary insights If bees sleep as they do do they dream Why is that insect copulating with an orchid Why have sponges evolved a system of fiber optics What do mantis shrimps and submarines have in common If dinosaurs had not gone extinct what would have happened next Will a saber toothed cat ever re evolve Conway Morris observes Even amongst the mammals let alone the entire tree of life humans represent one minute twig of a vast and largely fossilized arborescence Every living species is a linear descendant of an immense string of now vanished ancestors but evolution itself is the very reverse of linear

Rather it is endlessly exploratory probing the vast spaces of biological hyperspace Indeed this book is a celebration of how our world is and was populated by a riot of forms a coruscating tapestry of life The *Runes of Evolution* is the most definitive synthesis of evolutionary convergence to be published to date

Cell Signalling in Prokaryotes and Lower Metazoa I. Fairweather, 2013-11-11 Cell signalling lies at the heart of many biological processes and currently is the focus of intense research interest In

multicellular organisms it is central to how different types of cell communicate with each other and how they detect and respond to extracellular signals Intercellular communication is vital to single celled organisms as well allowing them to respond to environmental cues and signals To date much of the understanding of signalling mechanisms has come from research on specific cell types eg mouse lymphocyte and cardiomyocyte or on organisms in which communication systems such as nervous and endocrine systems are well established This volume therefore aims to fill the gap by concentrating on simple organisms where the elements of those signalling systems first evolved Many of the groups covered contain important pathogens or parasites and the potential for manipulating signalling pathways for therapeutic intervention will be highlighted
