

Fig. 9.14 - Checking spring tension on selector fork

Fig. 9.15 - Gear change seen from the front

To adjust spring tension:

1. Fit the selector fork shaft into the hole in the camshaft.
2. Fit a selector fork onto it.
3. Fit the spring assembly. Adjust the body against the screw.

The aim is to adjust the position of the spring when the selector is in the neutral position, such that there is a constant clearance between the edge of the spring and the selector fork and vertically, so that the push of the spring is to line with the selector fork when the spring is depressed as it will be when the cam plate pushes against it. Measure the spring with a finger to give you the check. When operated with the spring position, adjust the screw and check up the adjustment.

Fitting the (new) gear change spring (Fig. 9.16 and 9.17)

When fitted to the gear change shaft, a new spring should sit straight and be free, and should connect in line with the detent and horizontal. With the screw, it is having to move.

You have to actually fit and measure the spring. There is a bit of a trick to it. The part of the spring that is left - hard to describe, but it helps to get a wire through the hole in the hole to check the position.

There should also be no gap in the adjustment for the spring and the cam in the spring. If you are not happy with the fit of your new spring, take it back to the vendor and compare it with the quality of pattern parts there.
