

## Lesson 1: The Concept of a Function

### Classwork

#### Example 1

Suppose a moving object travels 256 feet in 4 seconds. Assume that the object travels at a constant speed; that is, the motion of the object is linear with a constant rate of change. Write a linear equation in two variables to represent the situation, and use it to make predictions about the distance traveled over various intervals of time.

$$\text{(X)} \frac{256 \text{ ft}}{4 \text{ sec}} = \frac{y}{x} \text{ (X)}$$

$$y = \frac{256}{4}x$$
$$\textcircled{y} = 64x$$

$$\frac{192}{3} = 64 \frac{\text{ft}}{\text{sec}}$$

| Number of seconds (x) | Distance traveled in feet (y) |
|-----------------------|-------------------------------|
| 1                     | 64                            |
| 2                     | 128                           |
| 3                     | 192                           |
| 4                     | 256                           |
