

Nitrogen Fixing Tree Start-up Guide

Nitrogen fixing trees (NFTs) have the ability to take nitrogen from the air and pass it on to other plants through the cycling of organic matter. Nitrogen is an essential nutrient for plant growth, and NFTs are a major source of nitrogen fertility in tropical ecosystems. When integrated with a farm, orchard, garden, or forest, NFTs can be a major source of nitrogen fertilizer and mulch for crops. Using NFTs can greatly reduce the need to purchase synthetic nitrogen fertilizers, thus lowering cash outputs and increasing self-sufficiency.

Aside from their nutrient and organic matter contribution, NFTs have many other uses on the farm, including animal fodder, bee forage (for honey production), living fences, wind shelter, and human food.

This guide provides basic information on how NFTs work, and details on how to plant, manage and use them to enhance soil fertility.

What are nitrogen fixing trees?

Nitrogen fixing trees (NFTs) are trees and shrubs that have the ability, through a symbiotic association with certain soil bacteria, to take nitrogen out of the air and use it for growth. This handbook focuses some on NFT species that are important in agriculture.

How NFTs get their nitrogen

Nitrogen is an essential nutrient for plant growth. Although the lack of nitrogen is often viewed as a problem in agriculture, nature has an immense reserve of nitrogen everywhere plants grow—in the air. Air consists of approximately 80% nitrogen gas (N_2), representing about 8000 lbs. of nitrogen above every acre of land (or 9000 kg above every hectare). However, N_2 is a stable gas, normally unavailable to plants. Nitrogen fixation is a process by which certain soil bacteria on the roots of nitrogen fixing plants “fix” or gather nitrogen from the air, and allow their NFT hosts to incorporate it into their leaves and tissues.

Amber Waves Catherine Zabinski,2020-09-01 A biography of a staple grain we often take for granted exploring how wheat went from wild grass to a world shaping crop At breakfast tables and bakeries we take for granted a grain that has made human civilization possible a cereal whose humble origins belie its world shaping power wheat Amber Waves tells the story of a group of grass species that first grew in scattered stands in the foothills of the Middle East until our ancestors discovered their value as a source of food Over thousands of years we moved their seeds to all but the polar regions of Earth slowly cultivating what we now know as wheat and in the process creating a world of cuisines that uses wheat seeds as a staple food Wheat spread across the globe but as ecologist Catherine Zabinski shows us a biography of wheat is not only the story of how plants ensure their own success from the earliest bread to the most mouthwatering pasta it is also a story of human ingenuity in producing enough food for ourselves and our communities Since the first harvest of the ancient grain we have perfected our farming systems to grow massive quantities of food producing one of our species global mega crops but at a great cost to ecological systems And despite our vast capacity to grow food we face problems with undernourishment both close to home and around the world Weaving together history evolution and ecology Zabinski s tale explores much more than the wild roots and rise of a now ubiquitous grain it illuminates our complex relationship with our crops both how we have transformed the plant species we use as food and how our society our culture has changed in response to the need to secure food sources From the origins of agriculture to gluten sensitivities from our first selection of the largest seeds from wheat s wild progenitors to the sequencing of the wheat genome and genetic engineering Amber Waves sheds new light on how we grow the food that sustains so much human life
