

3. The answer suggests that because there is no lens, (parallel rays) need to be kept. These rays would be parallel after their reflection.
4. Describe the rays showing that both the camera and the eye can see the image up of the eye, but not when there is no lens at the eye, that means the parallel rays that are not focused on the retina.

5. When a lens forms a virtual image, the image is upright and larger than the object.
- The image distance is greater than the object distance, and the image is located on the same side of the lens as the object.
6. Is the image inverted? (The eye can see the parallel rays that are not focused on the retina.)

The image distance is greater than the object distance, and the image is located on the same side of the lens as the object.

$$\frac{1}{d_o} + \frac{1}{d_i} = \frac{1}{f} \quad \text{or} \quad \frac{1}{d_o} = \frac{1}{f} - \frac{1}{d_i} \quad \text{or} \quad \frac{1}{d_o} = \frac{d_i - f}{f d_i} \quad \text{or} \quad d_o = \frac{f d_i}{d_i - f}$$

7. A single converging lens can form a single image, which may be real or virtual.
8. What is the image like for a converging lens? A diverging lens? (The eye can see the parallel rays that are not focused on the retina.)
- The image formed is real, inverted, and smaller than the object. A diverging lens forms a virtual, upright, and larger image.
9. There is a limit to how close an object can get to a converging lens. (The eye can see the parallel rays that are not focused on the retina.)

In the case of a converging lens, the object must be placed at the focal point of the lens to form a real image. Otherwise, the image is virtual, and the eye can see the parallel rays that are not focused on the retina.
