Convexity and connectivity of the solution space in machine learning problems Maxime Hardy, 2019-01-24 ScientiaRerum Thesis 2018 This thesis investigates properties of the solution space of the machine learning problem of random pattern classification Such properties as convexity of the space of solutions its connectivity and clusterization are studied Evidence has been provided recently that there exists a universality class for random pattern classification models making it possible to study the properties of the whole set of constraint satisfaction problems using the most simple model the perceptron with spherical constraint it is exactly solvable and exhibits the full stack of characteristic properties of that class In order to obtain statistically representative treatment of the model as opposed to the best worst case scenarios we used the well established methods of theoretical physics of disordered systems a k a spin glasses In terms of that science this model can be interpreted as a random packing problem and demonstrates the phenomenology of slow glassy relaxation and a jamming transition The specific property of that model is that the corresponding constraint satisfaction problems ceases to be convex The non convex domain is explored in detail in this thesis and its structure is presented on a phase diagram Publisher Scientia Rerum academic publishers Paris
