it is still possible to revert back to something lower level For instance there are hooks that can be used to wrap older logic that relies on the DOM This breaks the abstraction and ties your code to a specific environment but sometimes that s the pragmatic thing to do One of the fundamental problems of programming is how to deal with state Suppose you are developing a user interface and want to show the same data in multiple places How do you make sure the data is consistent Historically we have mixed the concerns of the DOM and state and tried to manage it there React solves this problem in a different way It introduced the concept of the Virtual DOM to the masses Virtual DOM exists on top of the actual DOM or some other render target It solves the state manipulation problem in its own way Whenever changes are made to it it figures out the best way to batch the changes to the underlying DOM structure It is able to propagate changes across its virtual tree as in the image above Virtual DOM Performance Handling the DOM manipulation this way can lead to increased performance Manipulating the DOM by hand tends to be inefficient and is hard to optimize By leaving the problem of DOM manipulation to a good implementation you can save a lot of time and effort React allows you to tune performance further by implementing hooks to adjust the way the virtual tree is updated Though this is often an optional step The biggest cost of Virtual DOM is that the implementation makes React quite big You can expect the bundle sizes of small applications to be around 150 200 kB minified React included gzipping will help but it s still big
