Polymerase Chain Reaction

Synopsis

In this Polymerase Chain Reaction (PCR) simulation, you will see through eight steps another method, known as restriction fragment length polymorphism (RFLP), for identifying the crime scene DNA sample. First, you'll see the subject's initial opinion on the issue that the investigator has left to you, at the end of each step.

Design the test

After sampling, you will go to the next screen where you'll see the sample of DNA you collected. By using a restriction enzyme, you'll see that the restriction from the crime scene is a set of 10,000 bp and that the restriction fragments approximately the 1000 bp fragments.

See the structure of the sample restriction gel image

In the simulation, you will see the first separation on the restriction gel, illustrating the structure of the test and the separation gel. You'll see the first separation of the experimental samples, as well as all the other steps of the test itself.

Identify the samples

In the first simulation, you will collect your samples and other samples collected from the laboratory. You will also see the restriction site structure.

Learning Objectives

In this part of the simulation, you will see the results:

1. Identify the location of the restriction site structure and the structure.
2. Identify the restriction site structure using the results of the restriction site structure.
