Polymerase Chain Reaction

Synopsis

In the Polymerase Chain Reaction (PCR) simulation, you will see through eight steps another reaction, similar to those that make plants, be multiplied exponentially, and you will find out the exact number of copies of the target DNA sequence in the test that the simulation will give you.

Design and

After sampling, you will go to the PCR simulation interface. The sample of DNA you collected by using a microchip is thermocycled, and this amplification from the initial sample is repeated 30 times. The final DNA sample contains approximately the 10⁷th generation.

How the structure of DNA results amplification of DNA

In the simulation, you will see the first generation of the template DNA, illustrating the structure of DNA and the replication cycle. Starting with the initial template, the exponential process, as well as all generations of the PCR, will be.

Identify the number

In the PCR simulation, you will collect your sample and other samples collected from the simulation, and you will find out the number of the template DNA sample.

Learning Objectives

In the PCR simulation, you will see the results:

1. Identify the function of each PCR component: primer, template, and dNTPs.
2. Explain the PCR process using the PCR cycle as the basis for the PCR.
