

Example of TEEL Paragraph

Bats are the only flying mammal in the world and flying squirrels actually glide. Bats are not birds as they do not lay eggs and give birth to babies directly. They also have mammary glands and can feed their new born milk. They also do not have coat on the body and wings are totally different from birds. They are made up of skin flaps stretched over a long bony fingers. It also has a tail which is make them more like rodents than birds. Some argue that they have seen flying squirrels and bats are not the exception. This takes away the prized title of "only flying mammal" from them. Let's return it back to its right full owner using some facts. What is flying? It is generation of sustained flight using physical energy produced inside the muscles. This in turn from chemical energy from the food. The direction should be universal and not restricted. What is gliding? It is done by using stretched skin or to move in a particular direction. The path can only be continuous and direction can be changed but only altered a bit. The motion is always from a high to low and there is no involvement of muscles in the flight other then changing directions. Now, calling gliding as flying is really a unscientific comment. One must understand the difference and do not draw comparison. Otherwise, will also start claiming to flying using jet packs and para gliders. Therefore, we can safe conclude that the bats are the only mammals that can fly. There are some species of rodents that can glide but the process and implications are very different.
