Fusion cell cloning

Fusion cell cloning involves replacing the nucleus of an unfertilised egg with the nucleus from a different cell. The replacement nucleus can come from an embryo, but if it comes from an adult cell, it is called adult cell cloning. Here's how she was produced:

1. An egg cell was removed from the ovary of an adult female sheep, and its nucleus removed.
2. The nucleus from an udder cell of a donor sheep was inserted into the empty egg cell.
3. The fused cell then began to develop normally, using genetic information from the donated DNA.
4. Before the dividing cells became specialised, the embryo was implanted into the uterus of a foster mother sheep.

Environmental causes of variation

Characteristics of animal and plant species can be affected by factors such as climate, diet, accidents, culture and lifestyle. For example, if you eat too much you will become heavier, and if you eat too little you will become lighter. A plant in the shade of a big tree will grow taller to reach more light.

Other examples of features that show environmental variation include:

- scars
- language and accent
- flower colour in hydrangeas as these plants produce blue flowers in acidic soil and pink flowers in alkaline soil

Genetic and environmental causes together

Some features vary because of a combination of genetic and environmental causes. For example, tall parents will pass genes to their children for height. Their children have the genetic potential to also be tall. However, if their diet is poor then they will not grow very well: their environment also has an impact on their height.

Highlight key words or phrases

Genetic causes of variation

Children generally look a little like their mother and their father, but are not identical to either. They inherit their features from each parent's DNA.

Every sperm and egg cell contains half of the genetic information needed for an individual. Each sex cell is known as haploid, which has half the normal number of chromosomes. When the chromosomes fuse during fertilisation, a new cell is formed, which is known as a zygote. It has all the genetic information needed for an individual, which is known as diploid and has the full number of chromosomes.

Examples of genetic variation in humans include blood group, skin colour and natural eye colour. Biological sex is also an inherited variation - whether you are male or female is a result of genes you inherited from your parents.

nonfiction work of the year Minneapolis Star Tribune Celebrated New York Times columnist and science writer Carl Zimmer presents a profoundly original perspective on what we pass along from generation to generation Charles Darwin played a crucial part in turning heredity into a scientific question and yet he failed spectacularly to answer it The birth of genetics in the early 1900s seemed to do precisely that Gradually people translated their old notions about heredity into a language of genes As the technology for studying genes became cheaper millions of people ordered genetic tests to link themselves to missing parents to distant ancestors to ethnic identities But Zimmer writes Each of us carries an amalgam of fragments of DNA stitched together from some of our many ancestors Each piece has its own ancestry traveling a different path back through human history A particular fragment may sometimes be cause for worry but most of our DNA influences who we are our appearance our height our penchants in inconceivably subtle ways Heredity isn't just about genes that pass from parent to child Heredity continues within our own bodies as a single cell gives rise to trillions of cells that make up our bodies We say we inherit genes from our ancestors using a word that once referred to kingdoms and estates but we inherit other things that matter as much or more to our lives from microbes to technologies we use to make life more comfortable We need a new definition of what heredity is and through Carl Zimmer's lucid exposition and storytelling this resounding tour de force delivers it Weaving historical and current scientific research his own experience with his two daughters and the kind of original reporting expected of one of the world's best science journalists Zimmer ultimately unpacks urgent bioethical quandaries arising from new biomedical technologies but also long standing presumptions about who we really are and what we can pass on to future generations
